The fuel committee of the Society of Automobile Engineers has recommended that an appropriation of $20,000 be made to install a laboratory, equip it properly, employ a trained expert and maintain the laboratory for a year. The committee making the report was composed of E. E. Sweet, C. E. Grimes and N. B. Pope. The fuel investigation was ordered by the Automobile Chamber of Commerce and the cost is to be borne by the manufacturers. It is proposed to use the laboratory to test all new appliances intended to make use of the heavier fuels which the shortage and rising price of gasoline have made essential. The committee recommended that the laboratory be established either in Indianapolis or Detroit.

E. W. Johnson, Fresno representative of S. G. Chapman, San Francisco, Cal., the northern California distributor of Hupmobile cars, made by the Hupp Motor Car Company, Detroit, recently created a new road record between Los Angeles and San Francisco by 3:05, making the distance in exactly 14 hours flat. The former record was held by the Cadillac car, made by the Cadillac Motor Car Company, Detroit.

ANNUAL BAY STATE OUTING.

Boston Motorists Enjoy a Day and Night at Lake Spofford, N. H.

The members of the Bay State Automobile Association and their guests, numbering about 150 people, enjoyed a delightful outing at Lake Spofford, N. H., June 16. Chairman W. H. Stevens of the runs and tours committee, and his associates, Walter Williams and Chase Langmaid, had everything ready for their reception when President Gilmore and his party arrived.

During the day the members patronized the lawn tennis courts and golf links, while there was also a ball game. In the evening the ballroom was the scene of a lively social event and it was voted one of the best outings ever held by the association. The tourists were given the choice of three different routes to the resort and all were well covered by various parties. The run home was made the following day.

Wells Lighting Generator with Cover Removed to Show Magneto Shunt Controlling Output.

GALVESTON BEACH RACES.

Plans Under Way for Another Meet This Year in July.

Plans for the race meet on the beach at Galveston, Tex., are under way and Capt. J. W. Munn recently visited the North in the interest of the event, which is to be held under the direction of the Galveston Automobile Club, July 28, 29 and 30. The big feature of the meet will be the 200-mile race, for which a prize of $5000 is offered.

Inasmuch as Pablo Beach and Ormond-Daytona in Florida no longer hold out inducements for beach racing, Galveston is approaching this enterprise in a big way and expects to eclipse the meets of the past three years, which have been very successful. A representative of the Galveston club interviewed a number of the drivers at Indianapolis who competed in the 500-mile race and many of them have signified their intention of entering.

WELLS LIGHTING DYNAMO.

Variable Speed of Car Is Compensated for by Magnetic Shunt.

While it is a simple matter to construct a dynamo for lighting purposes when the machine is driven at a constant speed, the utilization of a generator on the automobile presents problems among which is the compensation of the variable speeds of the motor. The R. C. Wells Manufacturing Company, Fond Du Lac, Wis., maker of the Wells lighting generator, holds that its system operates perfectly at all ratios.

The Wells generator is very compact, weighs but 19.5 pounds, and is of the bipolar type. It supplies current direct to the lamps, the storage battery being utilized as an auxiliary and when the voltage of the dynamo falls below a predetermined value. The control of the current is automatic, being held at a proper value by a magnetic shunt.

This device is simple in construction and operation, weakening the current when the output would be too strong or augmenting it when of low value. An automatic magnetic switch is utilized for opening and closing the circuit between the generator and battery, the latter being brought into service at very low car speeds. One of the features emphasized with the Wells is that the cells are properly charged at all times and that being constructed of high grade material and workmanship, it requires no other attention than an occasional oiling.

The last two days of the 32nd annual exhibition of the Taylor Fair Association, Taylor, Tex., July 3-4, will be devoted to motor racing under the rules and sanction of the contest board of the A. A. A. Three races will be conducted each day.

ANNUAL TOURING NUMBER.

The Automobile Journal's Seventh Routing Guide to Be Issued July 10.

The Seventh Annual Touring Number of The Automobile Journal will be issued July 10. In keeping with the demand for authentic information covering all phases of motor touring, every effort has been made to compile a list of routes, including every section of the United States, a portion of Canada and some of the richest touring ground in Europe. New features have been added, which are expected to meet with decided approval. Aside from the tours themselves, full information is given concerning the motoring laws of the several states, shipping the car abroad, sailing dates, preparation of the car for the season's touring and its care and maintenance, while en route, wearing apparel for men and women, etc.

Inasmuch as the Annual Touring Numbers of The Automobile Journal are retained in constant use, being carried in the car throughout the entire touring season, it has been decided to bind this edition in a heavy cover, thereby making it even more serviceable in this respect. Particular attention has been paid to the matter of illustrations, from the special cover design throughout the entire magazine. In every way the number will be an edition de luxe.

Anticipating a large demand for this number, several thousands additional copies will be printed, but as there already is a large waiting list it is advisable to place orders for the extra copies needed as early as possible.

PLANS FACTORY ADDITION.

Service Recorder Company Expanding Under Direction of New General Manager.

H. T. Boulden, formerly general sales manager of the Ohio Motor Car Company, Cincinnati, O., maker of Ohio cars, is now vice president and general manager of the Service Recorder Company, Cleveland, O. With a modern, aggressive executive of Mr. Boulden's type, who has had wide experience in the pleasure car and motor truck industries, the Servis recorder is expected to become a decided factor in the accessory field.

An active sales organization has been brought together and 15 factory branches already have been established. To afford adequate facilities for meeting the increased sales an addition to the present plant is contemplated at East 105th street and Quincy avenue, Cleveland.

RED ROLL AUTO WASTE.

Novel and Convenient Form of Compressing Waste Into Individual Rolls.

Waste is indispensible to the motorist. It is superior to other forms of material, such as cloth for example, as it readily absorbs all lubricants and moisture. Having a fine texture it may be utilized on highly polished surfaces without danger of scratching and it makes an excellent polishing material. Until very recently waste came in bulk; that is, in large bundles. When purchasing in this form it is necessary to break or tear the material to secure a handful and this method leads to waste as frequently too large a quantity is used.

The Union Wadding Company, Pawtucket, R. I., has originated a novel method of compressing into a single sturdy container, 12 separate handfuls of waste, each one of which may be taken from the package without disturbing the others. As will be noted by the accompanying illustration the material is compressed into a compact roll, sufficient for all ordinary requirements. The advantage of this packing is obvious. It keeps the waste clean, prevents it tangling up tools, etc., when carried in the tool box; can be stored in a very small space and is always handy for use. The package is but 12 by three inches, and the container is of sturdy construction. The waste is a specially selected long fibre. The Union Red Roll Auto Waste is not only inexpensive, but the convenience of the package will appeal to automobilists, motor boat men and the garage man. It has been placed on sale at garages and supply houses.

Illustrating the Convenience and Compactness of the Union Red Roll Auto Waste, Marketed by the Union Wadding Company.

SPLITDORF

"Always There"

Investigation by Commission

may have its advantages from a Congressional standpoint, but PERSONAL INVESTIGATION cannot be surpassed as a means of obtaining a real intimate knowledge of the superior qualities of SPLITDORF SPARK PLUGS.

And SPLITDORF PLUGS will come through any and every personal investigation—no matter how thorough, or how searching—with the unqualified endorsement of: "THE BEST SPARK PLUG ON THE MARKET."

There's no dodging the issue—the SPLITDORF ELECTRICAL COMPANY is bigger and better than ever—it GUARANTEES ITS PRODUCT and stands committed to every claim it makes for the goods bearing its trademark.

A PERSONAL INVESTIGATION TODAY will convince the most skeptical that the SPLITDORF SPARK PLUG, with the hexagonal porcelain, and with the SPLITDORF trademark stamped on the shell, is the commonsense plug for every-day usage, gas-tight, soot-proof and unbreakable.

Remember, All! "New ignition for old" is our slogan—We have a SPECIAL EXCHANGE proposition of the greatest interest to every owner of a gasoline motor who would save time and money. Write or call TODAY for particulars.

ST. PETERSBURG EXHIBITION.

Representatives of American Automobile Manufacturers Meet with Much Success.

With much pomp and ceremony the international automobile exhibition was opened recently at St. Petersburg, Russia, and it was one of the most successful events ever held in that country. That Russia is just realizing the advantages of motor vehicles, both from a standpoint of travel and utility, is apparent, for the government officials are displaying much interest in the subject and have encouraged manufacturers in foreign countries, and particularly those in the United States, to exhibit their machines there. Russia has many bad roads and although the demand for motor cars is increasing rapidly, the country itself has only two small factories.

The cars made in this country are better suited to road conditions in Russia than many of those produced abroad. At this show there are 65 exhibitors, as follows: Germany, 26; France, 17; England, nine; Italy, six; United States, six; Belgium, four; Russia, two; Switzerland, two; Sweden, two; Austria, one. The business done thus far is reported to have left much to be desired as prospective purchasers were still hesitating. However, representatives of American automobiles reported better results in thise line than did most of the others.

ADDS ONE-TON MODEL.

Charles L. Barker, Norwalk, Conn., to Increase His Line Very Materially.

Charles L. Barker, Norwalk, Conn., builder of engines and the Barker three-ton truck, has begun the construction of Barker one-ton motor wagons, in which a combination of the best tried and proven units, assembled in the simplest and most practical forms for commercial service, are to be united to make a most serviceable vehicle. It is stated that the new departure of Mr. Barker contains a considerably smaller number of parts than do a majority of the motor vehicles of its class.

The machine is being built with a view of filling the needs of farmers and others having loads of moderate size and is so designed that the comparatively low upkeep cost enables the truck to do the work of from two to four double teams according to the length of the haul.

Ask the Man Who Owns One.

GET YOUR GASOLINE AT HALF PRICE.

By using the M&M Economizer.

WHAT YOU CAN DO WITH THE M&M ECONOMIZER!

YOU can save from 40 to 50% of gasoline. YOU can obtain 20% more speed and power than you can without it. YOU can develop more power in high altitudes. YOU can keep the cylinders clean and cool your engine at all times. YOU can use the M&M just like the coaster brake on a bicycle. YOU can use it as an air brake in descending grades, at the same time taking off the ignition. YOU can save wear and tear on clutch brakes and tires. YOU can immediately secure the proper mixture for different weather conditions without readjusting your carburetor. YOU can set your throttle at 12 miles per hour, and increase your speed and power to 18 or 20 miles, with the same amount of gasoline, and less carbon, simply by opening the M&M Economizer.

Pat. Europe Pat. America

Showing M&M Attached with ½" Elbow.

The M&M is nickel plated and highly polished. It is made with one ground valve and six portholes, which when open, admit auxiliary air into the manifold. The gas coming from the carburetor is broken up and sprayed by the incoming air, so that when it reaches the cylinders it is a gas of the greatest explosive power.

READ WHAT A MITCHELL OWNER SAYS ABOUT THE M&M!

Moller Bros., Philadelphia, Penn. Watertown, S. D., May 29, 1913.

Gentlemen:—I have had the M&M Economizer installed on my 1910 Model T 35 h. p. Mitchell Touring Car, and I am very much pleased with it. It does all you claim for it in saving gasoline, and also gives more speed and power. It also saves clutch and brakes, and, in fact, it is the finest attachment I have ever seen. Yours very truly, WM. F. UTHE. (Signed)

The automobile attachment requires a ¾" pipe tap to insert into manifold, but same can be reduced to ½" by means of an elbow or a common reducer. It is controlled either by friction foot pedal, or steering post control, which includes flexible shaft and wire. The motorcycle size is ¼".

OUR GUARANTEE.

WE POSITIVELY guarantee the M&M to do just what we claim, or money will be refunded in 30 days. (Reference—Citizens National Bank, Lewistown, Penn.) No dealer or jobber is authorized to sell without giving our guarantee.

Price of Automobile size—$3.50 and 17c extra for postage. Price of Motorcycle size—$1.25 prepaid.

SEND FOR OUR CATALOGUE. BEWARE OF INFRINGEMENTS!

25 Miles to Gallon

PAID FOR ITSELF

Lawrence, Mass., May 16, 1913.
Gentlemen:—I get 20 miles and over on a gallon and I never got more than 14 miles on the ——— I took off. G. A. Schmidt.

19 to Gallon on Cadillac

Planhard Co.—Edgewater, N. J., May 21, 1912.
I am very much pleased with my new Planhard Carburetor. I made a test of gasoline consumption from Edgewater to Hyde Park, N. Y., and return, and got a fraction over nineteen miles to the gallon. This is on my Cadillac.
John H. Hinners.

18 Miles on Buick

Malvern, Iowa, April 8, 1913.
Gentlemen:—The Planhard beats anything I ever saw. My first run was 55 miles on 3 gallons, and roads not good anywhere, 20 miles being very hilly and rough. An auto man said it was simply a wonder. It is a peach. Impossible to make it miss. Lots of power. All O. K. believe me. J. A. Tyler.

3¾ More Miles

When Planhard Carburetors were put on the 6 cylinder, 4 cycle Frisbie motor of the fast boat Delphi II, she increased 230 R. P. M., and 3¾ more miles per hour.

Much More Power

Bath Marine Construction Co.—"The gasoline consumption at normal power was better than others and it would develop much more power when pushed." H. D. Bacon, President.

On a Ford

North Fairfield, O., May 16, 1913.
Gentlemen:—After taking the old Carburetor off my Ford car and putting on a Planhard, I increased my mileage from 18 to 25 miles per gallon, and my engine, which was a notorious heater, runs as cool as desirable for the best results. I am using 60 to 62 gasoline, and as I have a hydrometer, I know what I am talking about. A. W. Grandon.

Gallon Less Per Hour

The "Black Eagle" Spark Plug

PATENTED

50 Cents Is Enough

The "Black Eagle" Spark Plug has made good because it was designed and manufactured with this result in view.

A person in close touch with the supply and manufacturing ends of the trade was a visitor at our factory recently, and was shown the details of construction, including the machinery, testing, and assembling of the "BLACK EAGLE" Spark Plug. What he said we believe will be of interest to you, as it indicates the effort on our part to supply a high grade plug at a reasonable price. We therefore quote below his impressions.

"I am simply amazed at the workmanship, material, and construction of the 'BLACK EAGLE' Spark Plug. When I saw this plug advertised at a price of 50c to the consumer, I naturally supposed it was a cheap, common, plug such as you occasionally find in jobbing houses on the bargain counter. I am convinced, after seeing these plugs tested, and examining minutely the machine parts which enter into their construction, that **no better porcelain spark plug is offered by any one, regardless of the price they ask.**"

We are not **influenced** by what our competitors **charge for spark plugs!** We have **ignored price precedent,** for the reason that a **high grade spark plug** can be manufactured and sold at **50c each, and that is enough.**

Sent prepaid on receipt of price. Made in all standard threads.

THE STANDARD CO. **Torrington, Conn., U. S. A.**

The *Pilot* "The Car Ahead"

Three Great Models. Pilot 40, four-cylinders, 4 1-2x5. Brake test, 53 horse power. 120-in. wheel base. Price, $2000. Pilot 50, four-cylinders, 4 1-2x6. Brake test 59 horse power. 126-in. wheel base. Price, $2250. Pilot 60, six-cylinders, 4x6. Brake test 67 horse power. 132-in. wheel base. Price, $2,500.

The Car Without a Mechanical Defect

Pyrene
TRADE MARK
FIRE EXTINGUISHER
FOR MOTOR CARS

Every motor car and garage should be protected by Pyrene Fire Extinguishers.

Remember that Pyrene is the only effective extinguisher of gasolene fires.

Pyrene is a combination of powerful gases in liquid form. As it touches the fire, Pyrene Liquid is converted into a dense white gas blanket which surrounds the fire and smothers it instantly.

Write for booklet.

Included in the lists of approved Fire Appliances issued by the National Board of Fire Underwriters.

The Man Who Takes Care Of His Car Knows—

He Has Found Out The Advantages of Using HIGH GRADE OILS.

That's why he always insists on

HARRIS
TRADE MARK REG. U.S. PAT. OFF.
OILS

He makes sure that his car is properly lubricated.

There are good reasons for HARRIS OILS being America's Leading Lubricants.

First of all, they are made from the very finest Pennsylvania Crude stock—by a process evolved from 28 years' experience. They contain no soot-producing carbon and are test-free from impurities.

This means that HARRIS OILS are all lubrication.

"A Little Goes A Long Way And Every Drop Counts."

If your dealer does not sell HARRIS OILS, send us 80 cents for 1 gal. can, or $3.75 for 5 gal. can and we will send same prepaid.

FISK Tubes

Fisk Inner Tubes Are Not *Simply* Tubes

They Are Dollars in Your Pocket because they Greatly Reduce Your Tube Expense

FISK TUBES ARE PERFECT. There is no guess work, no chance about them. We have doubled the service and halved the expense for thousands of tube buyers. *We can do it for you.* Our confidence is based on a long record of actual accomplishment.

Fisk Tubes are pure gum tubes, made of the finest Pure Para Rubber vulcanized by the aid of sulphur to exactly the right degree to produce long life. You cannot take one of them in your hand without appreciating its quality from the texture.

Fisk Tubes have an original splicing which makes thin spots impossible. They are never porous. The construction is such that no imperfection can be present to develop a slow, but constant leak of air.

Send to Dept. 24 for Sample Section of Fisk Tube. It Tells the Story of Fisk Quality.

Fisk Tubes are built regardless of cost. The only economy which is recognized is that which we can ultimately offer YOU as a tire user. Only a tube built like the Fisk can give FISK SERVICE.

The Enjoyment of the Tour Depends on Your Equipment

IF your ignition system does not give you maximum results, if you experience that continual missing that racks engines and puts nerves on edge, if you don't obtain the economy and reliability that regularly is obtained from a Bosch Magneto and Bosch Spark Plugs, you can't enjoy your tour—you can't be satisfied.

Nearly Two Million Use the Bosch Magneto

Millions Now Use Bosch Spark Plugs

Bosch Magneto and Bosch Plugs

give the greatest economy. It is an ignition system of world-wide reputation for supplying continuous sparks at the precise moment and of such intensity as to assure the utmost efficiency and economy.

You can place every confidence in your ignition system if it is the Bosch System —you will have freedom from delays, you will have no expensive repairs, you will have absolute reliability and the greatest possible efficiency.

All the Good Cars Use Bosch—You Can Have Bosch Too

Be Satisfied *Write for Literature* *Specify Bosch*

Our Exclusive Feature

We will (at small extra cost) furnish our Regular Models with the

AUSTIN

Two-Speed Axle

This axle provides two different gear ratios, both on direct drive, and in combination with a three-speed transmission gives six speeds forward and two reverse.

Model "77" has a Regular Direct Drive of 3 1-2 to 1, and a Special Direct Drive of 2 to 1.
Model "55" has a Regular Direct Drive of 4 1-2 to 1, and a Special Direct Drive of 3 to 1.

The Regular Direct Drive provides ample power and exceptional ease of control for hills, bad roads and crowded city traffic.

The Special Direct Drive for normal conditions, shows a gain of over 50% in mileage for the same fuel consumption and motor speed, eliminates the noise, wear and tear of running the motor at excessive speeds, adds materially to the life and durability of the car and pleasure of riding.

Model "77" Six Cylinders, 4 1-2 x 7 - - $6000.00
Model "66" Six Cylinders, 4 1-2 x 5 1-2 - - $5000.00
Model "55" Six Cylinders, 4 x 5 - - - $4000.00

MORE NEW, IMPROVED and **DISTINCTIVE FEATURES** than any other car. Two-speed rear axle, high pressure air self-starting system, complete electric lighting system, left hand steer, center control, two-spark magneto, four-speed transmission, both brakes controlled by foot pedals.

Write for complete description and any information you may desire in regard to our two-speed axle.

MARMON

"The Easiest Riding Car In The World"

Illustrating The Marmon "48" Seven-Passenger Touring Car

Touring in a Marmon---

is different. There is physical satisfaction in the luxurious comfort of the smooth, even-balanced bodies hung to absorb the shocks and bumps and make every road easier. There is mental satisfaction in the knowledge that every detail of this car is proved trustworthy and capable—that anywhere an automobile can go the Marmon will take you with safety and comfort.

Mr. Carl G. Fisher, president of the Prest-O-Lite Company, founder of the great Coast-to-Coast rock highway, and head of the Indianapolis Motor Speedway, recently purchased a Marmon "Thirty-Two" five-passenger touring car for his own use in the Indiana-Pacific tour of the I. A. M. A., leaving Indianapolis for San Francisco and Los Angeles, July 1st.

The touring records of the Marmon are ample proof of its value on the road.

In the Minneapolis-Helena, Montana, tour for the Minneapolis Journal trophy in 1911 the Marmon was the only registered stock touring car to finish the 1,461 miles with a perfect score—without even a tire change or puncture.

In 1912, it again won the same trophy in the tour to Winnipeg and return of 1,088 miles—again without even a tire change or a puncture.

In July, 1912, Four-States Tour of the Indiana Automobile Manufacturers Association it covered the 1,267 miles again without a tire change or puncture.

The wonderful performance of the Marmon, not only in these tours or in its world-famed list of racing victories, but in actual service in the hands of owners everywhere, is proof of its value. Its unusual balance of power to weight, its superlative endurance coupled with its luxurious and economical operation should command your investigation.

The Marmon "32"

A sensible, logical car—a car of moderate size and capacity, meeting every requirement for touring and city use, with the economy in tires, fuel and upkeep so important to the majority of motorists. Four-Cylinder, 32-40 h. p., 120-inch wheel base, electric starting and lighting system, with body types to meet every requirement and corresponding equipment. Touring Car, $3,000.

Detailed Information on Request

F. E. Wing Motor Car Co.

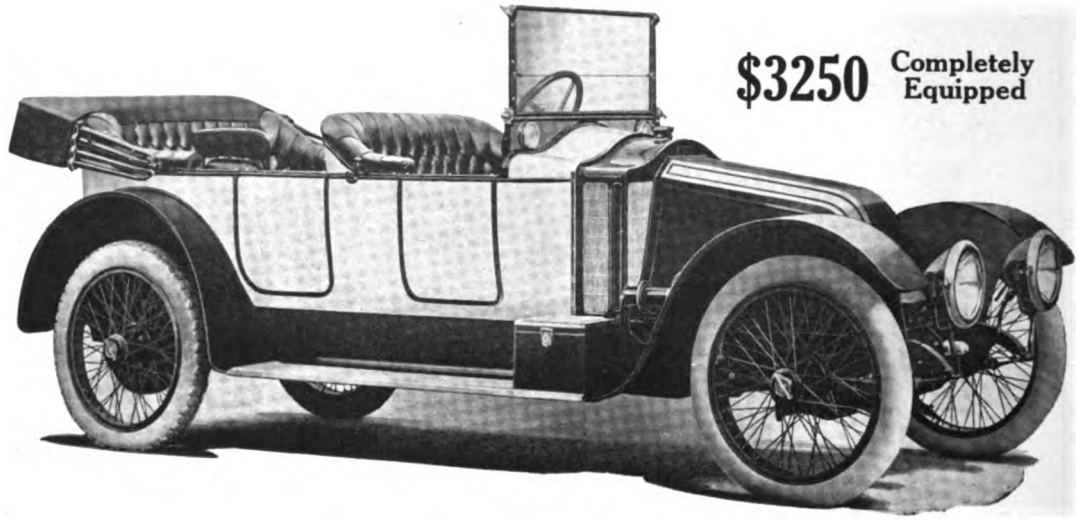
New England Dealers

Nordyke & Marmon Company

Indianapolis (Est. 1851) Indiana



The Marmon "48"

Six-cylinder, 48-80 h. p., 145-inch wheel base—a large car with small car advantages, a car with short turning ability which eliminates the old objections to long wheel base—a car of wonderful and surpassing riding qualities: electric starting and lighting system, with body types to meet every requirement and corresponding equipment. Touring Car, $5,000.

"SIX-48" KEETON

THE COOLEST CAR FOR SUMMER TOURING

"Six-48" Riverside Touring Car

In the hot summer months the front compartment in the ordinary type of fore door car is excessively warm, causing great discomfort to the occupants. This is due to the method of drawing the air through the radiator in front and forcing it back over the engine and out underneath the front floor boards. This hot air keeps the front compartment at an almost unbearable degree of temperature. Many makers have tried to overcome this by using ventilators, hinging the doors so that they are partly open—tilting the wind shield back and many other makeshifts that are only partly successful.

The front compartment of the Keeton is always at an even cool temperature. The hot air is forced out through the sides of the radiator away from the car. There is a draft of cool air under the front floor boards at all times.

The French type of the Keeton with its sloping hood also gives the driver a better view of the road directly in front of the car. This feature makes the Keeton more easily handled on rough roads or in night driving where it is imperative to get an unobstructed view of the road immediately in front of the car.

The long wheel base—wire wheels with big tires—long flat springs of special alloy spring Steels—the balance of weight gained by the dash location of the radiator—the light weight—smooth running 6 cylinder motor with its great freedom from vibration and the luxuriously roomy body all combine to insure an ease and comfort that is unequalled.

Digitized by Google

All the accessories are placed in the handiest position, the clock and speedometer are mounted on the secondary dash and illuminated by the battery charging signal light and are plainly visible by the occupants of the tonneau.

The spare wire wheel is carried on a false hub over the gasoline tank at the rear of the car and is put on and taken off in the same manner as the other wheels.

The starting and lighting switch is easily reached by the driver—next to the gear shifting lever at his right hand.

In fact all the points in the Keeton construction show a careful application of sound engineering principles adapted to the convenience and comfort of the passengers.

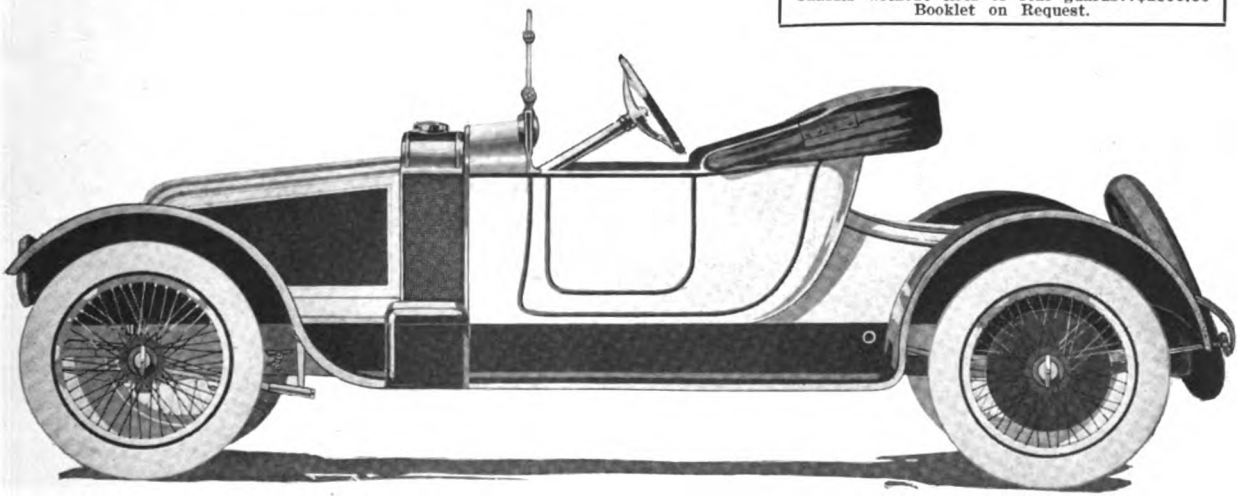
Let us describe this car in detail to you.

KEETON
DETROIT, U.S.A.

IMPORTANT FEATURES
BRIEF SPECIFICATIONS

Electric starting.
Full electric light equipment.
Small 3¾-inch bore—long 5½-inch stroke.
Cylinders cast en bloc, large valves.
All moving parts completely enclosed.
Exceptionally powerful and flexible.
The most efficient cooling system in use today.
Radiator at rear of motor in proper and protected position.
Four speeds forward in transmission.
Direct on 3rd—geared up on 4th.
Left side drive—right hand control.
Wire wheels—60% more tire mileage.
Extra detachable wire wheel.
Long 136-inch wheel base—long springs, special alloy spring steel, nearly flat under load.
Chrome Vanadium Gears and Shafts on imported annular bearings.
Pressure gasoline feed.
Very roomy and comfortable bodies.
Best of foreign practice adapted to American road and touring conditions.

COMPLETE EQUIPMENT



Electric starting and lighting system with 12½-inch headlights, dash lamps and tail lamp with license holder; 80-mile speedometer and eight-day clock combined with electric light; lamp for changing tires at night, with extension cord; dynamo electric horn; robe and foot rails; silk mohair top, with self-contained folding curtains and slip cover; double acting rain vision wind shield; option of wire wheels with extra detachable wire wheel or wood wheel with extra demountable rim; wheel or tire carrying irons; full set of tools; pump; jack and tire repair outfit; all touring bodies have two auxiliary seats.

The Touring Success of the EMPIRE

EMPIRE, the Lightest Entry in the Indiana-Pacific Coast Tour. Started July 1

The Empire five-passenger touring car now on its way from Indianapolis to the Pacific Ocean is the lightest car of the Indiana Manufacturing contingent making this 3575 mile tour. It is the only popular priced car of the tour. It sells completely equipped for $950.00.

EMPIRE, Official Pathfinder and Pilot of the Little Glidden Tour. Started June 23

The Empire was selected to blaze the trail for Iowa's Little Glidden. Through gumbo mud it plowed on schedule time. On June 23d it started the tour proper as the official pilot of this important endurance tour run under strict A. A. A. reliability rules.

It was the sturdy reliability and touring excellence of the Empire and its economy of up-keep and operation that brought the great flood of orders.

It is largely because of this that we are quadrupling our output for next season: and the increased production is under way right now.

Keep Your Eye on the EMPIRE---"The Little Aristocrat"

5-Passenger Touring Car, Completely Equipped, $950.00.

"The right way to light the way."

Penetrates fog, mist and rain with a strong, far-reaching ray

APLCO

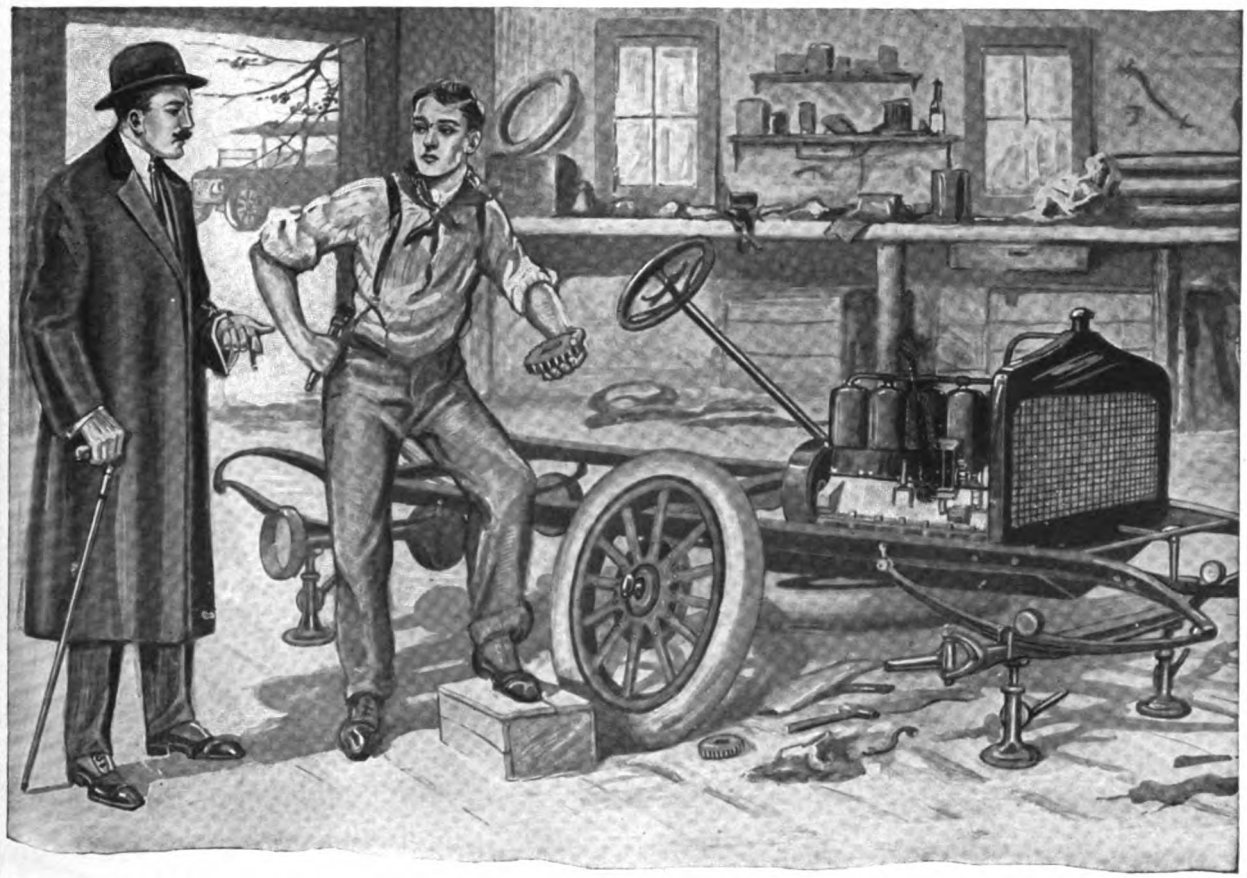
Get Aplco Electric Lights now

YOU must understand clearly that it's very easy to have your car equipped with the] Aplco electric lighting system.

It isn't in any sense a serious operation and it doesn't cost much; it's worth what it does cost in freedom from anxiety when you are driving at night.

Your car can be Aplco equipped in no time, without disturbing its motive power, "messing up" the engine installation, consuming any of its present horse power or laying up the car for any length of time. It makes no difference whether you are using the old style gas lamps, or whether you have electric lights supplied by a storage battery; the complete Aplco system can be installed quickly, easily and at a low cost.

When you once have the Aplco System on your car you're ready to really enjoy night driving; no gas tanks to exchange or batteries to have recharged, to say nothing of being caught without gas or juice just when you need it most.



There's a good dealer near by who handles Aplco lighting outfits and the famous Apiglow lamps which throw a light that penetrates fog and dust as well as darkness, and can be turned down like a gas light. If you don't know who he is—you should, and we will tell you if you ask.

You will want more details and information than we can give you in this advertisement; better send at once for bulletins and other useful facts that will show you how effective the Aplco equipment can be in your present car; why you will want it in your new car.

Drop us a line. We will tell you what equipment you need, send you descriptive matter and give you the name of the nearest dealer handling Aplco devices.

BURN-BOSTON BATTERY

One-third size.
Use them exactly like dry cells.

A Message to Motorists!

Cut your battery cost.

Raise your battery efficiency.

BURN-BOSTONS will do for you from three to twelve times the work of dry cells.

They will do it more cheaply and more efficiently.

The manufacturers of the Klaxon horn write:

> "We are accustomed to recommend ——————storage battery and **your liquid cell.**"

The reason is that while (we quote them again) "the ordinary dry cell lasts four to six weeks for ordinary touring purposes before the voltage runs too low"—Burn-Bostons on two test runs conducted by the Klaxon people sounded 35,980 and 50,000 calls respectively on six cells. 36,000 is equivalent to fifty calls per day for two years.

On May 31st last we renewed a set that had been in use on Klaxon and Gauge Light since April, 1909.

What about the ignition? F. R. Parker, the Elmore agent in Boston, writes of his experience with six Burn-Boston Batteries used on a four cylinder car with Atwater Kent coil, and without other ignition. He concludes thus:

> "This makes a total distance to date of approximately 14,000 miles, distributed through a period of more than one year and two months, without attention to batteries and yet running strong."

The Burn-Boston Battery is firing the coast defense guns of the United States from Eastport to Cavite.

Why? Because until Burn-Bostons are worn out in service they never fail to respond, no matter what their age or the conditions of storage.

Six of them will run you a full season. Ten of them will start you, run you, light your small lights, and warn for you a full season.

Get them from your dealer before you begin that tour. In the unlikely event of your dealer not having the Burn-Boston Battery order of us direct—mentioning your dealer's name—and we will see that you are supplied promptly.

BURN-BOSTON BATTERY, 19 Doane St., Boston, Mass.

BOWDENISM

The Science of Simple Control.

—

We feel a particular gratification in the fact that our earliest conviction with regard to the control of motor cars, motor cycles and aeroplanes—that they would eventually be controlled from the steering wheel and handle-bar through flexible wires—has come true.

During the early days of pioneer work the inestimable advantages of Bowden Wire control were so palpable to us that we steadily and confidently persisted, and from the moment when manufacturers began to adopt our method, up to the present time of its universality, it has been our pleasure to supply to the trade, and to the public, every fitment pertaining to these controls.

Trade and public will readily appreciate the value to themselves of these years of concentration and experience.

German Chrome Steel Balls

THESE balls are of extreme accuracy, both as to size and sphericity, and are of high finish. They are the product of the largest Steel Ball plant in Continental Europe.

The grade of balls which we import is that employed exclusively by Fichtel & Sachs in their well-known and established product known as the "F. & S. Annular Ball Bearings."

We particularly call attention to the fact that the steel balls which we import are made of the finest chrome steel, and that the great ball making plant we represent is equipped with the latest and best of modern machinery for turning out steel balls, producing only the finest, and that today none in the industry can compete with this plant in either quality or quantity production.

During a score of years, the twenty years of time in which the plant has been thoroughly established, it has always been its aim to produce the best output possible, to make balls of superior hardness and extreme accuracy, and of the finest polish and finish, and that it has reached the highest possible point in this respect is evident from the fact that the best and greatest ball bearing makers all over the world use and recommend its steel balls; and these ball bearing makers have for many years been steady customers, taking nearly the whole of the big output.

We also call your attention to the fact that this already large and exclusively ball making plant has just been greatly enlarged, so that we are now more able than ever to guarantee prompt deliveries at all times.

INVA

DISPUTES end where figures begin, and differences of opinion can exist only when the thing differed about is incapable of being reduced to measurable dimensions.

¶ An automobile manufacturer, for instance, will exhaust his vocabulary in a glowing description of the magnificence of his upholstery or the easy riding qualities of his springs, while he will not exaggerate by so much as a hair the size of his wheels. Why? Simply because wheels can be measured and their size expressed in definite terms, while "easy riding" qualities cannot be so expressed and any exaggerations therefore are not so apt to get him into trouble.

¶ It is a fact not generally appreciated that all lubricating oils can be definitely tested and their relative fitness for automobile cylinder lubrication accurately ascertained and definitely expressed in figures that cannot be contradicted.

¶ It is a well-known fact, for instance, that an oil should have a high fire test to enable it to withstand, so far as possible, the heat generated by the exploding gases, yet many oils are being advertised and sold today with a fire test far below the required standard. It is a well-known fact that light gravity oils contain less carbon than heavy gravity oils—yet many heavy gravity oils are being marketed which are so full of carbon as to be practically unfit for use.

Digitized by Google

DER OIL

¶ Just as long as an oil company can take an ordinary heavy gravity machinery oil and get automobilists to buy it through the simple expedient of advertising it in general terms as a "perfect" motor oil, whose "body" is just suited to the requirements of their particular car, just so long will motors wear out before their time. But, if the many oils now being advertised in such general terms were to be presented for your consideration in specific terms of their comparative physical tests, more good oils would be used and less poor oils would be advertised.

¶ *Invader Oil has the lightest gravity. It contains the least carbon. It is best because its physical tests are best*

Cartercar

"Gearless" Means Satisfied Owners!

And you know that the best advertising, the best selling force you can have is satisfied owners. A satisfied owner will bring in sales—will increase your profits—will build for you a permanent business. This fact, that the Cartercar does satisfy, is the reason why the Cartercar has so many unchanged agencies today.

THERE'S NOTHING TO BREAK— a Cartercar has no gears—no clutch—and consequently when it gets in a tight place there is nothing to cause trouble.

A CARTERCAR WILL CLIMB steep hills—go through bad sand and mud— and do it continually, whithout any bad effects upon the car. The driver has the satisfaction of knowing that his car will go anywhere—and that it will come back again.

UNLIMITED SPEEDS—is another valuable feature of the Cartercar. Ail controlled by a single lever. Simple driving, quietness, and smoothness in running have made this car remarkably popular with ladies.

NO JERKS NOR JARS in starting and changing speeds; gives you about twice the usual tire mileage. This must also mean less upkeep expense for all parts.

YOU AT ONCE REALIZE the advantages of being the representative of such a remarkable service car. You can readily see the opportunities for building a good business for the future.

THE CARTERCAR ANSWERS every requirement of those buyers who demand full value for their money—the people who must get service. And you know that nine-tenths of the buyers today are in this class.

Every Inch a Car

A striking new "Six" at $2350

A new model has been added to the KisselKar line—THE 48 "SIX"—a silent, powerful, well groomed thoroughbred, that sets a new level of comparison and is bound to turn discriminating automobile buyers in the direction of the KisselKar.

The announcement of this new KisselKar model is of greater significance than an ordinary announcement because it carries with it a notice of changing conditions in automobile making—the establishment of values and prices upon a more solid and settled manufacturing basis.

A few years ago, when the KisselKar 60 "Six" was announced, it was at once acclaimed the sensational value in "Sixes". It was the first "Six" to respond to the demand for a high powered six cylinder automobile at a moderate price. HISTORY IS NOW REPEATING ITSELF.

Digitized by Google

KISSELKAR

Electric Lighted and Started 48 "Six" Left-hand Drive—Center Control

In presenting the new KisselKar 48 "Six" at $2350, the Kissel Motor Car Company is again making automobile history as it did with the big KisselKar 60 "Six" five years ago.

The KisselKar 48 "Six" is the latest big thing in six cylinder automobiles. Point for point, it challenges comparison—in construction, performance, comfort and refinement.

The design is strikingly handsome and original, representing the very best ideas of American and European body construction—a design we expect to see freely copied a year hence. In the 48 "Six" we have succeeded in producing a liberally designed, roomy five passenger, six cylinder automobile of medium size that fills the gap between the so-called "little sixes" and the high powered "big sixes."

It requires but a slight study of the KisselKar 48 "Six" to prove it a worthy exponent of all that is best in automobile construction. Its smooth running, silent, powerful and flexible motor has loads of excess power, and is responsive to every demand. Clean, graceful lines, low hanging body, perfect poise and balance, big roomy tonneau, extra long wheelbase, big tires, extra deep luxuriously upholstered seats combine to make the KisselKar 48 "Six" a car of superlative beauty and riding comfort.

TO OWNERS

The KisselKar line now comprises three striking pleasure car models—the new 48 "Six" at $2350, the 60 "Six" at $3150 and the 40 "Four" at $1850—each an unsurpassed value in its class. An illustrated portfolio giving all details of each model will be sent on request.

TO DEALERS

Our recently acquired Milwaukee plant will be devoted exclusively to the manufacture of the KisselKar 48 "Six." As this gives us a largely increased output, we are in position to add to our list of desirable distributors. If interested, write.

KisselKar Trucks—1500 lbs. to 6 tons—are used in over 200 distinct lines of business. Write for Truck Catalog.

KISSEL MOTOR CAR CO., 174 Kissel Avenue, Hartford, Wis.

BOSTON, NEW YORK, CHICAGO, MILWAUKEE, KANSAS CITY, MINNEAPOLIS, ST. PAUL, DALLAS, SAN FRANCISCO, LOS ANGELES, OAKLAND, Philadelphia, Detroit, Houston, El Paso, Washington, Baltimore, Nashville, Duluth, Buffalo, Pittsburg, Cincinnati, Hartford, Conn.: New Haven, Newark, Troy, Rochester, Providence, Montreal, Quebec, Toronto, Winnipeg, Calgary and 200 other principal points throughout America.

Features of the New KisselKar 48 "Six"

An entirely new model in design of chassis and body along the very latest ideas of motor car building.

Specially constructed frame hung close to the ground, with large "kick-up" in front and rear—providing plenty of spring clearance and allowing more flexible springs and riding comfort.

Clean and simple construction—at a glance you are impressed with the few number of parts.

Tonneau without boxes or brackets to mar the effect of simple completeness.

Rakish new design fenders with rounding tops instead of flat.

Front axle of foreign design with the castor principle, which allows easy turning of car and avoids accidents as the wheels are always kept in line. The construction of this axle also adds strength to the knuckles and main parts.

Large doors 21" wide and 5 passenger tonneau with room to spare.

Deep, low, properly proportioned seats. Backs pitched for extreme comfort—and cushioned with the finest upholstery.

Patented Golde top, which eliminates front brackets. This top is used only on the very best cars and is remarkably easy to put up and take down.

The "cowl" is equipped with a mahogany board on which all instruments are placed—accessible and convenient to line of vision.

Large 4½"x36" tires—giving the car oversize tires for its weight.

Special flexible spring construction which takes up the jolts and jars.

Extra long wheelbase, 132"—which provides space for roomy tonneaus and contributes to riding comfort.

Large gasoline tank (24 gal.) and tire irons in the rear.

Left-hand drive and center control.

Electric started. A simple and positive system that makes starting easy and sure.

Electric lighted. Big powerful electric lights of twice the candle power of average cars.

Powerful, easily accessible, long stroke motor, with large crank shafts carefully balanced—capable of developing plenty of excess power. Silent, smooth running, responsive.

Four speed transmission—direct drive on third.

Cone leather faced clutch can be disassembled without removing transmission or motor.

The KisselKar 48 "Six" is fully equipped in every detail and embodies every desirable feature for the comfort and convenience of the car owner.

KisselKar Service

The KisselKar is sold under a written guarantee of service to owners—a tangible, definite and specific contract that clearly stipulates the scope of KisselKar Service and provides for care that forestalls trouble and retards depreciation.

Do You Want To Double Your Tire Mileage?

That's what you will do if you ride on wire wheels instead of on wooden wheels. There are many reasons why the car owner who is looking for the utmost in motor car construction should insist upon wire wheels—such as ease of riding, ease of steering, lengthening of the life of the car itself, etc.—but the prime essential of all these considerations, obviously, is the fact that wire wheels increase the life of the tire anywhere from 25 to 50% or more.

By actual tests conducted over a period of six months, a saving of 68.75% was shown by the use of wire wheels compared with wooden wheels under exactly similar conditions.

Wire wheels save tires because they are light at the periphery, thereby reducing the road pound at point of contact. Wire wheels also radiate external and internal frictional heat which is held in the wall of the tire by wooden wheels because of the non-heat conductivity of the wooden bands.

If you are interested in this all important subject, write us for further details.

EAGLEINE the
NO-KARBON CYLINDER OIL
PROVEN PRODUCT

A few letters that back up our claim that EAGLEINE NO-KARBON OIL is the best oil produced for water-cooled motors.

"19,000 MILES—NOT AN OUNCE OF CARBON"

Salt Lake City, Utah, May 8, 1913.

I have just turned 19,000 miles with my car, which still delivers its maximum power and speed, although the valves have never been ground or an ounce of carbon taken out of the motor. I have never used a drop of any but Eagleine NO-KARBON oil in the car, and I will bet any man $50.00 that I haven't got two ounces of carbon in the four cylinders today.

C. R. PEARSALL.

"1,000 MILES—AND CLEAN PLUGS"

Kenosha, Wis., July 3, 1913.

After running 1000 miles I removed spark plugs, they were not even black with soot. That is the best I ever saw, by far; no other oil for me.

JOS. J. QUISMET.

"1,500 MILES—NEVER TOUCHED PLUG OR VALVE"

Los Angeles, Cal.

I am pleased to state that on my trial trip, which covered nearly 1500 miles, in which I used Eagleine NO-KARBON, I never touched a Spark Plug or Valve. This is the first severe test I have put your oil to, and it has answered in every respect.

ONE of the greatest pleasures of touring is quick relief from all mishaps. One of the most frequent and disagreeable mishaps is tire-trouble. And the quickest relief from tire-trouble is obtained by Stanweld demountable rim equipment.

So, to be assured of a pleasant trip no matter where or how far, be sure your car is equipped with Stanweld demountable rims.

Stanweld demountable rims prevent tire-wobbling---one of the prime causes of excessive tire-wear. They require no special tools. They have a solid base excluding dirt and moisture. They accept either straight-side or clincher tires. They have both the quick-detaching and demountable features---operating independently.

They are safe, easy, and quick to operate---requiring fewer manipulations than any other demountable rim.

One manufacturer will use nearly 50,000 sets during the coming year.

At Critical Times You Can Depend On

Multibestos BRAKE LINING

ON the steep hills and narrow, rock-strewn roads of country districts where danger lurks at every turn, it is of vital importance that your brakes be responsive and that you have the most perfect control over your car.

The rounding of any corner may bring you "head on" with a fellow motorist or heavy country wagon with scarcely room to pass and with the clearance of a bare few inches on the edge of a steep incline.

At times like this your brake lining carries the full load of responsibility and literally decides your fate.

It should be equal to such great responsibility.

It should be reliable and dependable in any emergency.

It should be Multibestos, the Brake Lining of Quality, with the Grip that Grips and with a strength which never fails in tight places.

—Why Dealers Lose Money

By C. P. Henderson

Years of concentrated study of conditions the automobile dealer faces have taught the faults that cost dealers their profits—how these things can be avoided—dealers who work for the manufacturer, not for themselves.

89% of all automobile dealers work for the manufacturer, not for *themselves.*

At the height of the selling season they sell cars the manufacturer can't deliver.

Some cars have chronic defects—the public learns them—dealers lose sales.

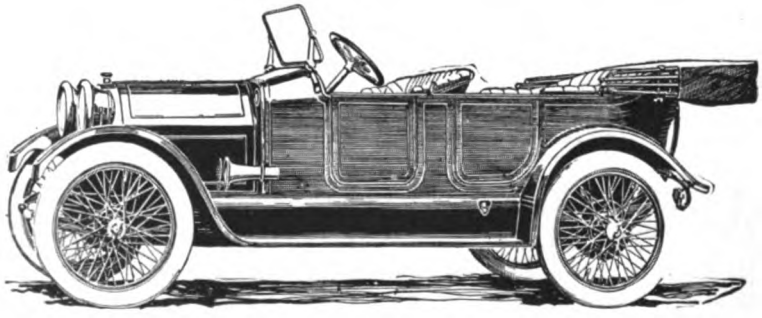
Some cars selling today are in reality 1911 models—not salable—yet they are crowded onto dealers. Eventually they go at a sacrifice of several hundred dollars. The manufacturer has *his profit,* the dealer *his loss.*

Every dealer should be selling and delivering 1914 models *today.*

There are myriads of other reasons why dealers lose, selling the average car, *even though it has a large sale.*

How We Conquered Resistance

But we have conquered every resistance in the Henderson car. Our 1914 models are out today—Henderson dealers are *selling* them—and *DELIVERING* them.



We build one year ahead of average cars—for instance, today a prospect can purchase a kerosene-burning car, a wire-wheeled car, the cowl dash, the cowl gasoline tank, left drive, center seat control and, of course, electric self-cranking system and electric lights on the Henderson.

Buyers can get Hendersons *Now.*

These facts are vital to every dealer—they mean dealer *profit.* Is not such a line of cars exactly what you must have to make money, or to make *more* than you made last year? Other dealers in your territory are reading this article. They will write us about the line. *You* write *today.*

Big Doings for Haynes Dealers

Three new models; greatly increased output;

beautified body lines; complete electric control—electric starting, electric lighting, *electric gear shift;* many other new selling points in the car; new selling punch back of the car; new blood in the manufacturing, sales and advertising departments; big advertising campaign to help Haynes dealers

New Opportunity to a Few More Dealers to Handle the Haynes

"There's something doing in Kokomo"—you have doubtless heard this remark passed dozens of times among automobile men, who have been watching the recent developments at the Haynes Automobile Company.

With the same spirit of progress which created the First American Car and has always kept the Haynes in the foremost rank, the Haynes Company has added some top-notch men to an already efficient organization.

The new members of the executive staff were *picked* from the entire field. No one in the automobile business knows better how to build a car as it ought to be built, than Mr. A. G. Seiberling. He has an enviable record of over 25 years in important executive and purchasing positions—over a third of which have been spent in the automobile field. Mr. Seiberling has been acting as factory manager for the Haynes for a number of months back, and now takes up the work as general manager, pledged not only to keep the Haynes *always ahead* in the race, but to make an even greater increase in the output of Haynes cars for 1915. Mr. Seiberling's interest in the Haynes is more than impersonal, for he is a heavy stock holder.

In Mr. Geo. H. Strout, Haynes has a General Sales Manager who needs no introduction to the trade. There is probably no better known or more successful manager of automobile sales. Hundreds of dealers know him personally as a pace-making salesman, service-man, field-man, etc. With such a wonderful car as the Haynes to push, the work of Mr. Strout will be watched with much interest by his many friends. Dealers who wish to secure a part of the 1914 output of the Haynes should lose no time in communicating with Mr. Strout.

The new Advertising Manager of the Haynes, Mr. Robert Crawford, comes from the Chicago Portland Cement Company. Flattering offers were made to hold Mr. Crawford, but he had definitely decided to enter the automobile business over a year ago. He accepted his present position in preference to other automobile connections, because he *believes* in the Haynes car, and feels he can do his very best work for it—and Mr. Crawford's work has already made Haynes competition take notice. "Watch his smoke."

Elwood Haynes, President

Elwood Haynes started his career of invention at fifteen. After completing courses at Worcester Polytechnic Institute and Johns Hopkins University, he was constantly engaged in scientific work up to 1891, when he conceived the idea of the "horseless carriage." Preparing drawings, he employed two Kokomo machinists to assist in working out his plans. He made his first trip July 4, 1894. The original Haynes car is now an exhibit at Smithsonian Institute, Washington, D. C., and the placard authentically gives full credit to Elwood Haynes as its creator and builder.

The New Haynes Models

by Elwood Haynes

Creator of the First American Gasoline Car

THE new Haynes models demonstrate that our organization will always be ahead of the times—never a back number. We have always paid more attention to making a good car than to achieving a big output. This very fact has created a self-advertised demand which has required a constantly increasing production. The 1914 output will show a good healthy increase over 1913—and a still bigger production is already planned for 1915.

The new cars—both sixes and fours—are so good that I am satisfied with them. I have never been more enthusiastic over new Haynes models than I am over these.

The new cars have the most graceful lines possible, giving the long, sweeping appearance which suggests class and distinction. The lines of the back of the tonneau are especially handsome. The body lines of the sixes and fours are the same. One car is simply larger than the other.

Wonderful new conveniences have been added to the latest Haynes, which, backed by the prestige and reputation it already enjoys, makes it without a doubt the strongest selling proposition in the whole automobile field.

All New Haynes Models Will Be Standard Equipped With the Vulcan Electric Gear Shift

This is the most remarkable advance in automobile equipment that has ever been made. With the electric self-starter and lighting system it completes the electric control of the Haynes—makes it the most up-to-date car in the whole field.

Every modern development, every convenience that makes a car easy to run, pleasant to ride in and economical to finance, you find in the 1914 Haynes.

And back of all the convenience and up-to-dateness, the same sturdy, dependable quality that is keeping those good, old-time Haynes cars still on the road after years of service, will be always found in every car bearing the Haynes name.

We know absolutely the materials that go into every part of the Haynes. The entire car is made at our factory or under our supervision. We know the materials are right and the testing is thorough and dependable.

Digitized by Google

A. G. Seiberling, General Manager

Mr. Seiberling's business experience of over a quarter of a century ideally equips him for his duties as general manager of the Haynes. He knows how to purchase—he knows how to direct. He has held the important position of purchasing agent for such concerns as the Pittsburgh Plate Glass Co., Great Western Plate Glass Co. He organized the Peoria Rubber & Manufacturing Co. in 1896, and engineered a fortunate consolidation with another concern. He comes to the Haynes after ten successful years in the automobile field in important executive capacities.

Epoch-Making Wonder in Auto History—Electric Gear Shift and Starter

Combined in Standard Equipment on All New Haynes

Driving the latest Haynes car is a simple performance. After setting the spark and throttle levers in proper position, move the ignition switch to the button on the battery side. Push starter button marked "S" and hold down until motor starts. Removing pressure from starter button automatically breaks connection. Next throw ignition switch onto magneto button.

To start, press the low speed button No. 1, until it locks, pushing foot clutch forward to its furthest position. This produces an electrical contact that causes desired shift of gear instantly.

Second, High Gear, Reverse

To go into second gear, press button No. 2, repeating clutch movement. To go into third gear do likewise. To make car go backward when moving forward, bring to stop, then push button marked "R" and operate the clutch.

Driver Can Anticipate Gear Changes

With the electric gear shift, the driver can anticipate or select any gear change desired. For example, if car is going up a steep grade that may necessitate dropping into second gear before top is reached, button No. 2 can be pressed at any time and when car has slackened speed and motor is about to labor, the clutch lever can be pressed, completing connection and instantly throwing gear into second speed.

Arrangement of Gear Shift

The dial or round switch board containing the buttons which operate the gear shift is located at top of steering post. There are seven buttons marked as follows: "N" for neutral, "1," "2" and "3" for low, intermediate and high gears, "R" for reverse. "S" is the starting button, the central, unmarked button operates electric horn.

Changing From One Gear to Another

Pressing button "N" entirely clears the switch board, but not until driver has thrown out clutch to the limit. By pushing the clutch lever forward to a limited degree, the clutch can be slipped in the usual manner without in any way affecting the gear shift. When clutch has been pushed about half way out, any gear that is being used is brought into neutral position and by pushing the clutch pedal to the extreme limit, the gear is shifted into any other gear ratio that has been selected.

Perfectly Simple and a Proven Success

The Vulcan Electric Gear Shifting outfit is decidedly simple, both electrically and mechanically. Has been used on a Haynes Six for a long time. Never necessary to shift gears by hand.

Emergency Hand Gear Lever

Is provided the same as a crank is provided for emergency use, with any self-starter. Quickly attached, but unlikely to be needed.

The Mechanical Principle of the Vulcan Gear Shift

Is so simple as to be readily understood at once when it is seen at work. We'll be glad to send full particulars to any one desiring them.

Briefly, Solenoid coils or electromagnets are used to make the shift. These are energized by the battery which furnishes current for the electric starter and lights. The amount of current used is so small that it scarcely can be measured. The current is thrown from battery only for fractions of seconds, while gears are being shifted.

Advantages of Electric Gear Shift

Unnecessary to remove hands from wheel.

Driver can always anticipate speed changes before throwing out clutch pedal.

Clutch always disengaged, and gears drawn to neutral mechanically before a shift, rendering it impossible to strip a gear.

Gear changes made with great rapidity.

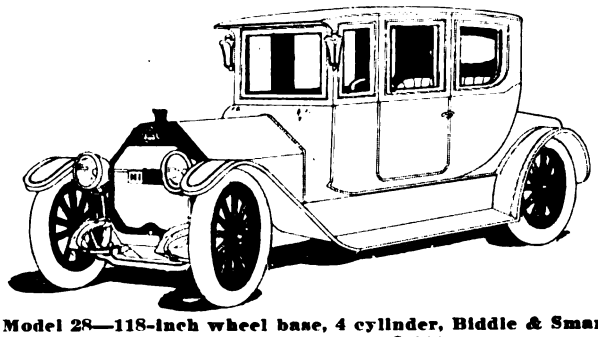
Frank N. Nutt, Chief Engineer

For ten of his fourteen years with Haynes, Mr. Nutt has been Engineer—first, Assistant then Chief. A born mechanic, at the early age of eight, he was spending his spare hours at his home-made draughting board or in the neighboring machine shop. Naturally he learned the machine trade at the first opportunity—and learned it well—of a painstaking French machinist. Mr. Nutt manufactured bicycles a few years, and has been with Haynes ever since. Mr. Nutt is well known as a driver in automobile contests and has long been identified with the S. A. E.



The Greatest Line-up of Specifications From a Selling Standpoint Ever Offered in Any Car at Any Price

Motor—4¼-inch bore, 5½-inch stroke, L-head Haynes design, cylinders cast in pairs. Enclosed valves.
Cooling—Centrifugal pump and pressed steel fan.
Wheel base—Model 26, 130 ins.; Model 27, 136 ins.; Model 28, 118 ins.
Ignition—American Simms magneto with patent pole shoe producing hot spark at full retard. Perfect synchronism, greater horsepower and more perfect running motor.
Lubrication—Splash and gravity feed to main bearings and idle gear, also constant feed to oil basins in lower base.
Control—Left hand drive. Vulcan electric gear shift, dispensing with hand lever and enabling driver to shift gears electrically with an instantaneous shift.
Transmission—Selective type, three speeds forward, one reverse. Timken roller bearings.
Steering Column—Worm and worm gear type.
Clutch—Haynes contracting steel band on steel drum. Supported by crank shaft. Easily adjustable with single set screw. Applies the power gradually.
Rear Axle—Timken full floating on Models 26 and 27. McCue axles on Model 28 with Gourney bearings.
Front Axle—I-beam, single piece, O. H. steel heat treated. 1¼-inch spindles of chrome nickel.
Wheels—Artillery type with Funk demountable rims.
Tires—Model 26, 36x4½ ins.; Model 27, 36x4½ ins.; Model 28, 34x4 ins.
Springs—Front, semi-elliptic. 39⅛ inches long, 2 inches wide; rear, 48 inches long, 2 inches wide.

Model 27—136-inch wheel base, 6 cylinder, 7 passenger body. Price, $2785.

Brakes—Contracting internal, expanding internal. Diameter 15½ external and 15 internal on Models 26 and 27, 12 and 16 on Model 28, both internal.
Finish—Body; Indiana dark blue, black gear and wheels—Pacific Tour gray body, black gear and wheels, optional. All metal equipment, gun metal, black enamel and nickel.
Gasoline Feed—Pressure feed. Storage tank holds 20 gallons gasoline. At rear of car where easily filled.
Upholstery—Models 26 and 27, hand buffed leather, Model 28, machine buffed. Cushions deep.
Starting and Lighting—Leece-Neville electrical system. A separate unit system embracing a generator for charging battery and motor for cranking engine. Has proved 100 per cent. efficient under all conditions. Exceedingly simple.
Cowl Board Equipment—Electric lights, sight oil feed, automatic cut-out for electric light, auxiliary air pressure pump with gauge, speedometer. Models 26 and 27 have rim wind clock.
Other Standard Equipment—Top, top cover of silk mohair, mechanical tire pump, rain vision ventilating wind shield, Vulcan electric gear shift, two large electric head lights, electric side lights, electric tail light, full cowl board equipment, electric starter, generator, 80 ampere hour storage battery, coat and foot rails, speedometer, horn, tire irons, full tool equipment, and one extra demountable rim.

Model 28—118-inch wheel base, 4 cylinder, Biddle & Smart Coupe body. Price, $2700.

"Wilhelm the First," Factory Manager

Germany has her Kaiser Wilhelm, but America has her A. N. Wilhelm, presiding genius at the Haynes factory. You'll find Mr. Wilhelm in overalls. He is literally "on the job," constantly going through the factory, taking in everything with a pair of penetrating steel gray eyes, stopping a man here and there with a pertinent query, always the master of the situation. Mr. Wilhelm is another born mechanic. "Kaiser" Wilhelm as factory superintendent of the Haynes has things moving with a smoothness and a precision that mean mechanical nicety and dependability in the finished cars.

Big Advertising Campaign

THE advantages of owning a Haynes Car will be advertised from now on in magazines, newspapers and farm papers, more aggressively and extensively than ever before.

The opening gun of our advertising campaign will be a two-page spread to appear in the Aug. 2nd issue of the Saturday Evening Post, to be closely followed by advertisements of similar size in Collier's Weekly, Harper's Weekly and big announcements in other magazines, newspapers and farm papers. Later on we will give you a glimpse of some of the great ads we are preparing.

Tens of thousands of dollars will be spent in the newspapers in the cities and towns *where our dealers do business.* We have a most liberal plan for co-operative local advertising campaigns, whereby we share the expense while the direct benefits go straight to the dealer.

Our advertising and sales departments will not only give efficient assistance in locating prospective purchasers, but will furnish dealers with selling suggestions which have been found by wide experience to be the most effective.

Great Book for Prospective Buyers

Written by Elwood Haynes

That Will Put Haynes Dealers in Touch With Thousands Who Are Going to Buy

No book has ever been written about the automobile that will be so valuable and so much wanted as this, written by the man who created the American Motor Car. This book will be offered to motorists in the magazines, farm paper and newspaper advertising. It will locate prospects for our dealer.

The Advertising Department will issue each month a magazine, "The Haynes Pioneer," full of selling punch and topics of live interest to Haynes dealers and owners.

Geo. H. Strout, General Sales Manager

As a lad in school and a college student, Mr. Strout was always a leader. Upon entering business his quality of leadership was so quickly apparent that within two years he was made Branch Manager for the Monarch Bicycle at New York. It was a logical step from the wheel to the automobile and in 1903 he formed the Western Automobile Company, St. Paul, and sold it in 1905 at a highly remunerative figure. Since then, in executive selling capacities with automobile concerns, he has become known to every automobile dealer, big and small, from coast to coast.

The Haynes Car is the Strongest Selling Proposition in the Field

There is no car on the market that is so brim full of strong talking points as the Haynes. In previous years, with its fame of being America's First Car, its 20 year record of reliable service, its strength, simplicity, symmetry, surety and satisfaction, it made the strongest kind of a selling proposition. The new models, with everything new in equipment, including the wonderful Electric Gear Shift, will coin money for Haynes dealers.

It Has a Strong Appeal to Every Member of the Family

Women Fall in Love With the Haynes at First Sight

The long, sweeping, beautiful lines of the new Haynes model compel admiration. The wide doors, the foot deep cushions, the liberal foot room of the tonneau, the roominess of the seats and the smooth-riding qualities of the car, captivate the ladies.

The new limousine and coupe bodies, with the graceful slope of roof and dome, and their exquisite finish, will have no superior.

Women who want to share the exhilaration of driving find the Haynes the car of their dreams. The complete control is centered on top of steering column in a fixed position and entirely operated by electricity. Think of it! Press a button and the starting motor begins to purr—press No. 1 button of the gear shift, and you're off on first speed, with every variation of speed under the absolute control of the finger tips.

Every convenience is found on the dash. There is the rim wind clock, switch for the electric lights, oil sight feed, ignition, automatic cut out for the lights, dash light, speedometer and auxiliary air pressure pump with air gauge.

The regular equipment includes mechanically operated tire pump—really a greater improvement than the self-starter.

The Haynes gasoline supply is pressure-feed. This means that the Haynes climbs grades of any pitch without trouble. Grades that are impossible to gravity feed type cars are easy for the Haynes. The storage tank holds twenty-one gallons of gasoline—three more than the usual size—and is at the rear of the car where it is easily refilled without disturbing occupants. This arrangement also leaves full carrying space under front seat.

Power, Dependability and Economy, Plus the Qualities Before Mentioned, Win Men to the Haynes

No man, whether he knows much or little about automobile engines, can fail to be impressed with the power plant of the Haynes. It is L-Head type—the type which most foreign cars now use, and extensively used by many of America's leading manufacturers.

The dependability of the Haynes car is proverbial. The most careful buyer feels safe in buying it. The Haynes is a whole car—a complete car—nothing in it for the sake of novelty—but everything for efficiency and economy.

The amount of gasoline required to run a Haynes, and cost of upkeep are convincing arguments in its favor. We furnish our dealers abundant proofs of this kind.

Robert Crawford, Advertising Manager

Mr. Crawford is best known for his work in the cement industry. First with the Universal Portland Cement Company, then as advertising manager of the Chicago Portland Cement Company, he won the reputation of getting more publicity for cement in general and for his own company in particular, than anyone else in a similar capacity. Mr. Crawford has achieved a considerable reputation for his exhibits at the Cement Shows and can be depended upon to even better this successful record of the past in his work for Haynes.

The Haynes Has Always Been a Good Money-maker—It Will Be a Money-coiner This Year

The Haynes has been piling up prestige for 20 years. It is always spoken of as a good car. It is a car that people are proud to own and proud to talk about—a car that attracts buyers and is easily sold. Every Haynes owner is enthusiastic over his car and boosting it continually to his friends. Most Haynes owners are friends of previous Haynes owners.

The Haynes for 1914 will be all this and more—in addition it will be the first car to have the wonderful electric gear shift—the first car entirely controlled by electrically operated devices.

Stays Sold—Real Profits

The Haynes is an easy car to sell—economical of salesmen's time. Once sold it stays sold. It is so simply and dependably made that trouble of any kind is almost unknown. The Haynes dealer is not continually pestered by the complaints of disgruntled owners, not driven to distraction by tales of twisted frames, broken springs, self-starters that won't start, engines that balk, and the hundred and one other things that take time and cut down profits.

Our Branches send out letters periodically to their list of Haynes owners in the cities and neighborhoods where they do business, to inquire if everything is all right and offer their service, if any is needed. 176 answered the last letter sent out by our Chicago Branch, and only two needed any service in connection with their car.

No Unkept Promises—Square Deal For All

Haynes dealers are not going to lose money through inability to get promised cars. We are careful not to promise beyond our output, or to take more dealers than we can provide cars for. We know it pays to play fair with our dealers.

Connect Up With Haynes—and You Do Business With a Concern That Is Firmly Established

A connection with Haynes means a permanent possession. The Haynes Automobile Company is a permanent institution. Solidly grounded. Conducted along safe lines. Believes in making a profit each year, not trusting to the future to come out from under tremendous overhead expenses and attain a hazardous success. Hundreds of automobile manufacturers have come and gone during the 20 years that the Haynes has been enjoying its steady, healthy growth. We contend that our policy of natural, steady growth is the safe, profitable way.

Connect up with Haynes, and you will not face the possibility of having to take up the sale of another make of car inside of a year or two, with all that means in the way of lost prestige and effort. Connect up with Haynes and you will be dealing with a concern that has proved itself substantial, and a money-maker—and whose dealers are making money, too.

Many Dealers Prize the Haynes Account as Their Most Valued Asset

The Increased Haynes Output Puts This Prize Within Your Reach—If You Act at Once

If you would like to line up with a car of established reputation, a car that is always spoken of highly, a car whose name as the first car carries with it no little degree of distinction, a car whose owners are boosters and always plugging the game of the Haynes dealer—if you would like to connect up with a manufacturer who believes in playing the game safe, whose credit is good, whose reputation for fair play is well known, whose prospects for the future show every indication of the same steady progress as in the past, who has been in business ever since the automobile business started in America—and will be in business, no doubt, as long as it lasts—if you want to handle a real car, with a real reputation and real selling merit, a car that fairly bristles with strong selling points, that again comes to the front as a pioneer in the use of *the electric gear shift*—here is your chance to get some of the increased output of the Haynes. The opportunity is so good that you had better wire your reservation. At least fill out the coupon, slip it in an envelope and send it under special delivery postage.

The TUTO HORN

AT EVERYMANS PRICE

Improvements and Manufacturing in large quantities make it possible to furnish the genuine $25.00 TUTO HORN for

$15.00

This new price includes all of the exclusive features that have made the TUTO HORN so practical and popular.

TWO-TONE FEATURE—Low note for regular service, loud note for emergencies—from the one horn and one button.

INSTANTANEOUS ACTION—No loss of time for motor to "speed up."

STEERING WHEEL FIXTURES—Protects the cord—gives neat, permanent job.

BUTTON ALWAYS UNDER THUMB—Gives quick action in case of emergency.

AUTOMATIC OPERATION—Unconscious gripping of button upon approach of danger forces button clear down and gives loud note—instantaneously. No hesitating, no selecting of horn buttons, etc.

RELIABILITY—Always responsive, as same button, cord and horn are used for both notes, thus are self-testing. There is nothing to oil or clean, so neglect will not interfere with operation or ruin the working parts, the same as in mechanical or motor horns.

LIBERAL GUARANTY—Guaranteed indefinitely against inherent defects or breakage of parts due to such defects. We always give the customer the benefit of the doubt.

NO EXPERIMENT—The Tuto Horn has been marketed for three years and has given unusual satisfaction through its reliability and freedom from trouble. This is proven positively by our records, which show that we have been called upon by less than 1% of Tuto owners for advice or repair parts.

10 Books 800 Pages of Text 1500 Illustrations

Automobile Owners **Automobile Repairmen** **Students**
Automobile Drivers **Automobile Dealers** **Engineers**

Each book has been thoroughly revised and its contents have been brought right up to the minute. The subjects have been treated in a simple, non-technical manner, making the discussions as valuable to the novice as the engineer. Eighty per cent. of the automobile and technical schools in the United States and Canada use these works as text books, and more than 500,000 copies are sold annually. No similar expositions are to be compared with them—regardless of price. Every car owner and operator should have the full set.

Knowledge of your car means additional pleasure in its use and decreased cost in operation and maintenance. The practical instruction that you need is to be found in these books, and to acquire the same fund of information in any other manner would require years of constant study. You must understand your motor if you would adjust or repair it. The subject is fully treated in the Engine book. This applies as well to the Magneto, Carburetor, Battery, Lighting, Chassis and Tire books. When overhauling and rebuilding, read that discussion. The book on Motor Car Operation covers that subject with reference to all cars. No matter what the need, there is a book to meet it. No car or component is neglected, and all standard engines, magnetos, carburetors, batteries, lighting systems and vehicles are dealt with. The full set includes:

Engine	$ .35	Motor Car Tires	$ .25	Magneto	$ .35
Carburetor	.35	The Motor Car Chassis	.25	Motor Car Operation	.50
Lighting by Electricity	.50	Motorcycle Construction, Care and Repair	.35	Overhauling, Rebuilding and Repairing	.50
Battery	.35

Directory of Touring Information

TOURISTS desiring to obtain the fuliest benefit from the routing directions presented in the American section of this Seventh Annual Touring Number, will find the information listed on the succeeding pages of the utmost value. The various itineraries have been prepared primarily to afford vacation tours, radiating from several important centres throughout the country, and it will be found that in most instances the routings bring the tourist back to the starting point. This does not apply to some of the tours in the South and the Far West.

However, a larger object is sought in providing itineraries that form a network of tours covering the entire country and portions of Canada. By careful study of the maps and routing directions it ought not to be difficult for the motorist to plan additional tours including any particular section or sections desired.

The information contained in this directory has been compiled with a view to affording assistance in this regard. The first four pages present a detailed index of prominent vacation spots, night stops and principal centres, with the route, page and map location for each, so that it is possible for the tourist to determine how best to reach any particular point.

In addition, there is presented a key to the route index, wherein is suggested a number of combinations, indicating the manner in which the various itineraries may be utilized. No attempt has been made to exhaust this phase of the subject, but it is assumed that with these examples the tourist will experience little difficulty in making such combinations as will meet with his needs.

IN LAYING OUT THE TOUR, ALWAYS USE THE KEY.
IT WILL MAKE THE SELECTION OF ROUTES
EASIER AND SIMPLIFY THE PLANNING
TO THE LAST DEGREE.

Mea Magneto

THE IGNITION SYSTEM FOR THE DISCRIMINATING

Owing to the spark of uniform intensity throughout a practically unlimited range of timing, the Mea increases the efficiency and flexibility of any motor.

CUT YOUR GASOLINE BILL IN HALF BY USING THE THE M&M ECONOMIZER

HOW ABOUT THIS LETTER!

Pat. Europe Pat. America

Showing M&M attached with 1-2" elbow

Temple, Texas, April 11th, '13.

Moller Brothers, Philadelphia, Penna.

Gentlemen:—On Mar. 17th, I noticed your advertisement of the M&M, and I immediately ordered one of them for my car. After receiving it, I immediately installed it on my U Light Six Stevens-Duryea car. I have given it what I call every test, and I certainly find it O. K. I would not be without this Economizer, as it certainly does everything you claim for it, and I am recommending it to my friends. Several of them will give you an order right away if they have not already done so. It pays to read advertisements as well as it does to advertise.

Yours very truly, A. E. NOBLE.

What You Can Do With the M&M Economizer

YOU can save from 40 to 50% of gasoline.

YOU can obtain 20% more speed and power than you can without it.

YOU can keep the cylinders clean, and cool your engine at all times.

YOU can use it just like the coaster brake on a bicycle.

YOU can develop more power in high altitudes.

YOU can use it as an air-brake in descending grades, at the same time taking off your ignition.

YOU can immediately secure the proper mixture for all weather conditions without re-adjusting your carburetor.

YOU can set the throttle at 12 miles per hour, and increase your mileage to eighteen or twenty miles, with the same amount of gasoline, and less carbon.

THE M&M WILL WORK ON ANY MAKE OF AUTOMOBILE OR MOTORCYLE ON THE MARKET, and it makes no difference what make of carburetor your car may have. **IF YOU KNEW THE AMOUNT OF AUXILIARY AIR YOUR MOTOR WOULD TAKE AT THE SPEED OF TWELVE MILES PER HOUR, YOU WOULD NOT HESITATE TO PURCHASE AN M&M.**

The M&M is made with one ground valve and six portholes, which when open admits auxiliary air into the manifold. The gas coming from the carburetor is broken up and sprayed by the incoming air, so that when it reaches the cylinders, **IT IS A GAS OF THE GREATEST EXPLOSIVE POWER.**

The M&M is nickel plated and highly polished. The automobile size requires a 3-4" pipe tap to insert into manifold, but same can be reduced to 1-2" if necessary. It is controlled by friction foot pedal, or steering post control which includes flexible shaft and wire. The motorcycle size is 1-4".

Price of Automobile Size, $3.50 and 17c extra for postage.
Price of Motorcycle Size, $1.25 prepaid.

WE GUARANTEE ABSOLUTE SATISFACTION. If the M&M should prove unsatisfactory in 30 days, **WE WILL POSITIVELY REFUND YOUR MONEY.** (Reference—Citizens National Bank, Lewistown, Pa.) No dealer, jobber or agent is allowed to sell without a guarantee.

BEWARE OF INFRINGEMENTS! Patented May 25, '09. No. 922528. **SEND FOR CATALOG.**

KEY TO ROUTE INDEX.

AS EXPLAINED elsewhere, the itineraries listed in this Seventh Annual Touring Number have been prepared with a view to connecting all sections of the country, so that it should be possible to start from any point and reach any other point. The several routings presented below indicate the manner in which the itineraries in this number may be utilized in planning additional tours. Obviously, it would prove impracticable to list more than a very small proportion of the possible tours which might be arranged in this manner, and it is assumed that with this guide the tourist will have no difficulty in making his own plans as he desires. However, The Automobile Journal is prepared to lend every assistance upon request.

TRANSCONTINENTAL TOUR A.

New York to	Route	Page	Miles

YOU SAVE as much money in the running of this car as you do in buying it

It is everyday testimony of owners of METZ cars that they make from 28 to 32 miles on ONE gallon of gasoline, a hundred miles on ONE pint of lubricating oil, and from 10,000 to 12,000 miles on ONE set of tires.

METZ "22"—$475

THE GEARLESS CAR

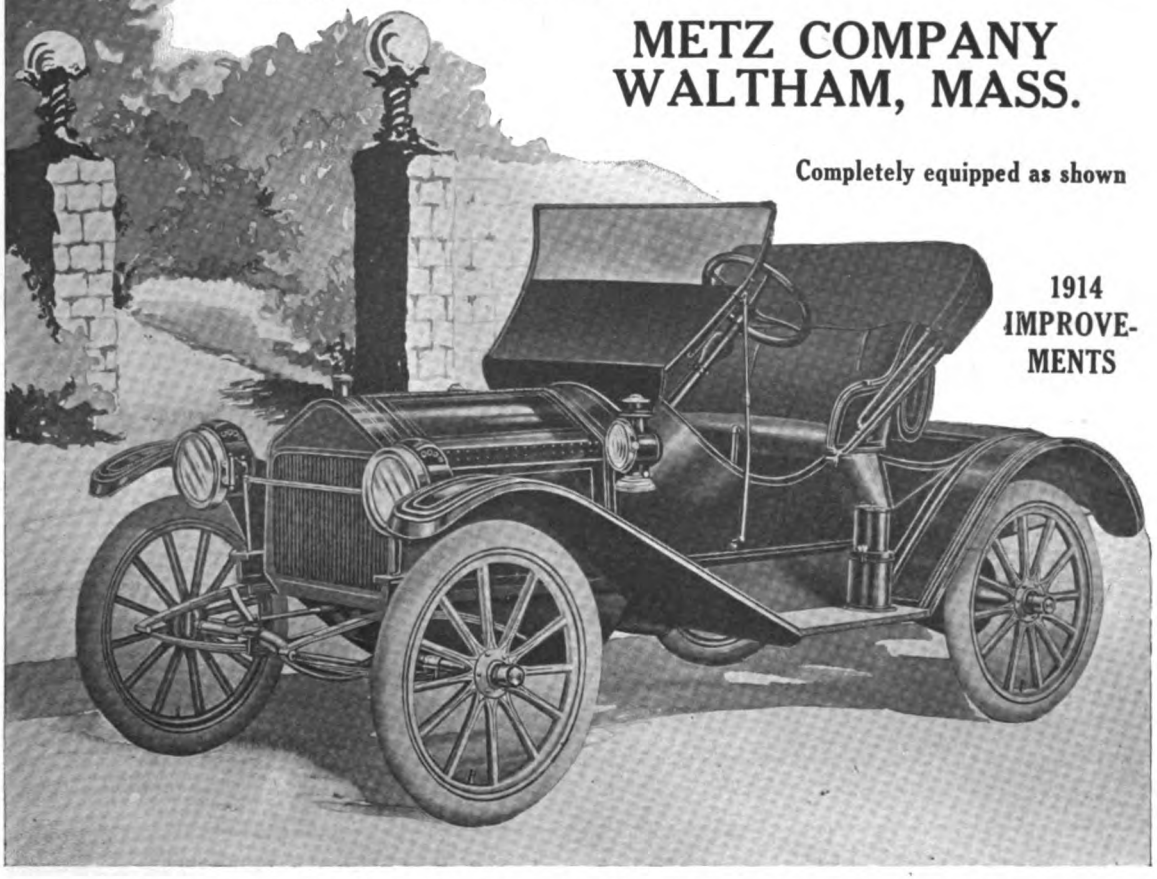
"No clutch to slip—No gears to strip"

A remarkable combination of low price and minimum cost of upkeep with the essential features of the strictly up-to-date car—a car that affords luxury without extravagance.

The METZ "22" is a high class, fully guaranteed roadster of the torpedo semi-enclosed type, left-hand drive and center control.

Equipped with 4-cylinder 22½ H. P. water-cooled motor, *Bosch magneto*, wind shield, extension top and cover slip, full elliptic springs all around, standard artillery wheels, best quality *Goodrich olincher tires*, 5 lamps and gas generator, horn, pump and tool outfit.

Will make from 5 to 50 miles per hour on the high speed, and climbs hills as fast as any regular stock car made. Built to carry either single or double rumble seat, if desired.



Write for our New Illustrated Catalog "Q"

Learn the facts about this really remarkable car, then draw your own conclusions. Send us your name and address today.

We want a representative in every city and town. Write for terms.

Publisher's Page

Within the past several weeks a number of publishers of motoring prints have compiled and published figures covering the amount of advertising copy appearing in leading motoring publications for certain stated periods, as compared with that for the same periods in 1912. Other publishers took exception to the facts as presented and in their zeal to make clear the status of their mediums immediately prepared tabulated statements giving similar information.

It would appear that such publishers believe that purchasers of advertising space are swayed solely by the amount of copy carried in the advertising sections of all trade prints. The tables presented did not indicate the amount of unpaid advertising, or the volume of dead copy carried for concerns that are known to be unable to pay for the service rendered. Furthermore, the amount of padded advertising copy that has been published was not designated. Nor did these tables show the enormous loss of advertising suffered by weekly automobile trade papers, and the gain made by monthly and semi-monthly publications in a business way, or the increased number of advertisers using such prints.

As a semi-monthly publication, The Automobile Journal is one of the magazines that is growing—gaining both in business and in circulation. It has but one rate, and it is giving better service to reader and advertiser than ever before. It carries no dead accounts, and permits no padding of its advertising section. It exends to all patrons, equal consideration. It does not now, nor never has, entered into the worst form of competition known to the industry—that of carrying what must be known as bad advertising accounts. Such procedure is often followed for no other purpose than to force reliable houses who do pay their bills to advertise extensively to protect their business interests.

The Automobile Journal is known as a strictly automobile owners' magazine, and less than eight per cent. of its distribution reaches any other clientele. Automobile owners constitute the market, as they are the men who spend the money. The Automobile Journal is an advertising medium that has always been productive of results, as is evidenced by the large number of the best known houses in all branches of the industry that are using this magazine regularly, and have been for a number of years.

Quality of contents means quality clientele. Magazines are read by subscribers only because of the value of what is presented in their editorial section. Exacting buyers of space are today using owners' publications. Figures prove this. There must be a reason.

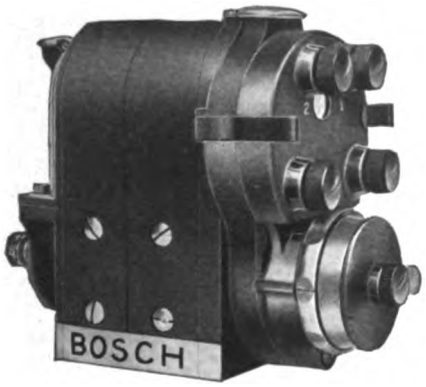
MOTOR PARTS CO



OFFICIAL BOSCH DISTRIBUTER

To the New England Motorists and Those Touring Through This Section:—

In order that you may have the best of Bosch service we have licensed the following companies in the various sections of New England as Bosch Sub-Stations. If you have ignition troubles, consult with them. At all times they carry a full and complete stock of BOSCH parts and their repair departments are absolutely guaranteed to do the best of work.

New England Licensed Sub-Stations

J. EDWARD NEWTON, Fall River, Mass.
AMERICAN BALL COMPANY, Providence, R. I.
NEWPORT ENGINEERING WORKS. Providence, R. I.
GEORGE B. WUESTEFELD, New Haven, Conn.
J. B. McCRILLIS & SON, Manchester, N. H.
Springfield, Mass.

We carry at all times a full and complete line of all Bosch Ignition Systems and Plugs. Our replacement department is at your immediate service for the duplication of all Bosch parts.

CONSULT US ON YOUR IGNITION PROBLEMS

National 40

The Unconquered Car

Still holds world's record for fastest competition 500 miles

NATIONAL 1912 78:72 miles per hour
1913 Winner - - 75:92 miles per hour
1911 Winner - - 74:61 miles per hour

Proud and Satisfied Owners

EVERY owner of a National car today has additional reason for pride. It is a satisfaction to own the unconquered car. The National year after year has consistently demonstrated its superiority. The National remains securely at the top of motor car achievements. There is genuine pleasure, confidence and comfort in driving a National, the champion car under any and all conditions and the one and only car that has made faster time in the 500-mile races than European cars.

The National knows no superior.

Long stroke motor (4⅞x6), left-side drive, center control, Gray & Davis electric starter, Gray & Davis dynamo electric lighting system, Bosch double dual magneto, multiple jet carburetor, 12-inch Turkish upholstery, tire pump integral part of motor, 128-inch wheelbase, full floating rear axle, concealed baggage compartments, tire carriers, full heavy nickel trimmings, powerful brakes, perfect oiling system, robe rail, foot rest, foot mat in running board, concealed tool box, electric horn, top, curtains, Truffault-Hartford Shock Absorbers in rear, adjustable ventilating and rain vision windshield and one extra Firestone demountable rim. Five models $2750 to $3400.

Write for copy of our story of the 500-mile race. Also ask for our illustrated catalog.

No-Rim-Cut Tires 10% Over-Capacity

Made In Secret

The essential feature in No-Rim-Cut tires is made under lock and key.

It cannot be copied. And a faultless tire without hooks on the base was never made without it.

That's why the legions who wish to end rim-cutting have come to No-Rim-Cut tires.

None Like It

Of course other makers try to end rim-cutting. It's the bugaboo of Tiredom.

More money has been spent on these attempts than on any other tire improvement.

But faults developed and tires came back. That's the only reason why any maker clings to clincher tires today.

We solved the problem by six flat bands of braided wires which we vulcanize into the tire base. We set them at certain angles.

This makes the hooked base unnecessary. It lets you turn your rim flanges outward. Not one of these tires has ever been rim-cut. And in seven years no fault has developed.

This is the feature which we control by secrecy.

Over Rated Capacity

No-Rim-Cut tires, compared with clinchers, are 10 per cent over-capacity. And that, on the average, adds 25 per cent to the tire mileage.

So we save rim-cutting and save overloading. And that means so much that Goodyear tires now far outsell all others. It means so much that last year's sales exceeded our previous 12 years put together.

GOODYEAR
AKRON, OHIO
No-Rim-Cut Tires
With or Without Non-Skid Treads

Write for the Goodyear Tire Book—14th-year edition. It tells all known ways to economize on tires

LENOX

THE ONLY CAR
MADE IN BOSTON

LENOX

The 1913 Lenox "Six"

MR. PROSPECTIVE BUYER

Pause for a moment and consider how the Lenox Car has come to the front. In 1911 forty cars were built and sold. In 1912 this increased two hundred per cent. and in 1913 this same increase in output was maintained.

WHAT IS THE ANSWER?

There can be but one—the Lenox Motor Car Company in producing the Lenox Car have not only used the best of material possible, but also the most modern and up-to-date designs known to the Automobile World.

PERFECT CONSTRUCTION

"That is good enough," or, "That will get by" are phrases that are unknown in the Lenox Factory. In building Lenox Cars one goal only is kept in mind, that is **Perfection.**

A BIG, ROOMY, LUXURIOUSLY APPOINTED CAR

Every owner of an automobile to-day, be it a four or six-cylinder, large or small horse-power roadster, touring car or limousine, one thing they all insist upon, that is **Comfort.** The Lenox Cars, with their deep Turkish upholstering, 3-4 elliptic springs, long wheel-base, large tires, and well-balanced motor, are a source of wonder to all who ride in them.

COMPLETE EQUIPMENT

Lenox Cars are completely equipped from wind-shield to detachable demountable rims, self-starter to electric lighting—every equipment the up-to-the-minute man could ask for.

EVERY CAR OWNER SHOULD USE ELECTRIC POLISHING CLOTHS. Keep the new car from looking old and shabby and make the old car look like new. No. 1 cloth removes all spots and stains. No. 2 cloth gives a hard dry polish that will not gather dust. Saves half the time in washing. Price 50 cents a set by Parcel Post. Order now. A. & R. Co., Wallingford, Conn.

Thousands of Car Owners All Over the World Are Using Blue Ribbon Goods

BLUE RIBBON METAL POLISH is the original "CREAM" Metal Polish and it still leads the procession.

BLUE RIBBON NICKEL POLISH is the result of 20 years' actual experience in manufacturing the finest gold and silver polishes. It is dangerous to use an experiment polish on fine nickel trimmings.

BLUE RIBBON AUTO BODY GLOSS revives and keeps the original factory finish and gloss on the body of the car—Shines like a mirror—No grease to catch dust—Leaves no coating.

BLUE RIBBON RADIATOR LEAK-PROOF CEMENT is a quick and permanent remedy for leaks. Does not clog the circulating system; prevents scale and rust; preserves the metal and increases the cooling capacity.

All **BLUE RIBBON** products strictly high class and fully guaranteed. **BLUE RIBBON** moves quick for the dealer—works fast for the consumer. **Ask for sample, giving us name of Dealer or Jobber.**

RUBY Portable STEEL Houses

A Private Garage for the Price of Six Months' Storage

If the high cost of gasoline has been worrying you, here is a way of off-setting it—own one of our **Fire-proof, Weather-tight, Sectional All-steel Garages!** It will pay for itself in six months' time!

Besides saving you money you will get more out of your car. Think of having your car ready at a moment's notice any time you want to use it.

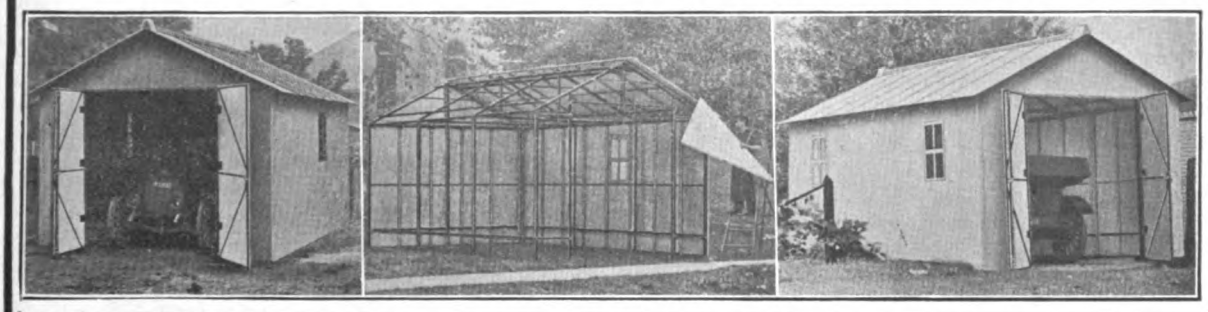
We make garages any desired size, and are producing them for a price which brings them within the reach of any car owner. Our buildings are furnished complete in every detail, from work-bench frame to locks on doors and windows.

Our buildings go together perfectly! The Fire-proof feature should appeal to your reason as a safe and economic proposition. It eliminates your risks of fire and saves useless high rate of insurance. You can erect your own building—no mechanic required. Easily put up and easily taken down.

Neat—Elegant—Durable—Can be painted any color.

Ruby Buildings come to you with a fifteen-year guarantee.

Our Special 10'x14' size for $120—other sizes in proportion.



Our sectional steel construction is also furnished for Motor Cycle purposes, Boat Houses, Store Houses, etc. Catalogue sent upon request.

AGENTS, WRITE FOR OUR PROPOSITION.

Seventh Annual Touring Number

SINCE it has become quite conventional for those in the industry to recall the past, thereby noting the substantial progress which has resulted in the few short years of its history, The Automobile Journal, in presenting its Seventh Annual Touring Number, may be pardoned for a personal word. Nothing demonstrates more clearly the wonderful growth of automobile touring than this special number of this magazine.

Seven years ago it was considered quite sufficient to provide routing directions for a small portion of the New England States. That motor cars were owned and operated in other sections is true, but only the most venturesome were inclined to take advantage of the possibilities afforded to visit this splendid vacation country. It is only necessary to compare that early number with the present, giving complete information covering the entire country, to indicate the surprising change which the automobile has wrought in the lives of the American people.

The Automobile Journal has sought to keep pace with the expansion of the industry in every respect. "See America First" has been the slogan of the motorist, and the Annual Touring Number has been developed as a compendium of touring information worthy of being retained throughout the season as an authoritative compilation—a book of reference to be carried in the car continuously.

It is proper to call attention to several innovations which are expected to meet with the hearty approval of the reader. Each American itinerary has been prepared with a view to connecting with every other, so that the motorist may start from any section of the country and visit any other section. In the preceding pages will be found a directory of touring information, in which are presented some suggestions for combining the various itineraries which follow. In addition, there is a complete index to the more important vacation spots, night stops and principal centres, giving the route, page and map location for each. The routing directions are printed in bold face type, thereby making them easier to read while in the car on the road, and still another innovation is to be found in the listing of the reverse mileage, by means of which the tourist is enabled to follow each itinerary in either direction. And it is possible as well, at all times, not only to ascertain the number of miles that have been covered, but the number of miles yet to be covered before reaching the night stop.

While too much emphasis cannot be laid upon the value of routing directions, there are other features of almost, if not quite, equal importance. Considerable space has been devoted herein to the presentation of mechanical articles on subjects of direct, personal interest to the touring motorist. They have been prepared with a view to offering exactly the advice required, when it is needed the most. With the possession of a modern car and the information contained in these discussions no motorist should hesitate to undertake a long distance tour of substantial proportions.

It is impossible to enumerate all the several departments. It seems quite sufficient to state that an effort has been made to foresee every need and offer a compilation of touring information that should present the utmost practicability in every respect. The entire work has been thoroughly revised and represents the very latest information concerning the subjects treated, as well as the territory covered.

Particular attention is drawn to the illustrations, and in this connection The Automobile Journal is indebted to a large number of parties for courtesies extended. So far as possible an attempt has been made to give credit in each instance, but a list of those who have rendered valuable assistance would include the leading railroad companies in the country, the boards of trade and chambers of commerce in practically all of the cities of the West and Pacific Coast, many automobile clubs and individuals.

THE EDITOR.

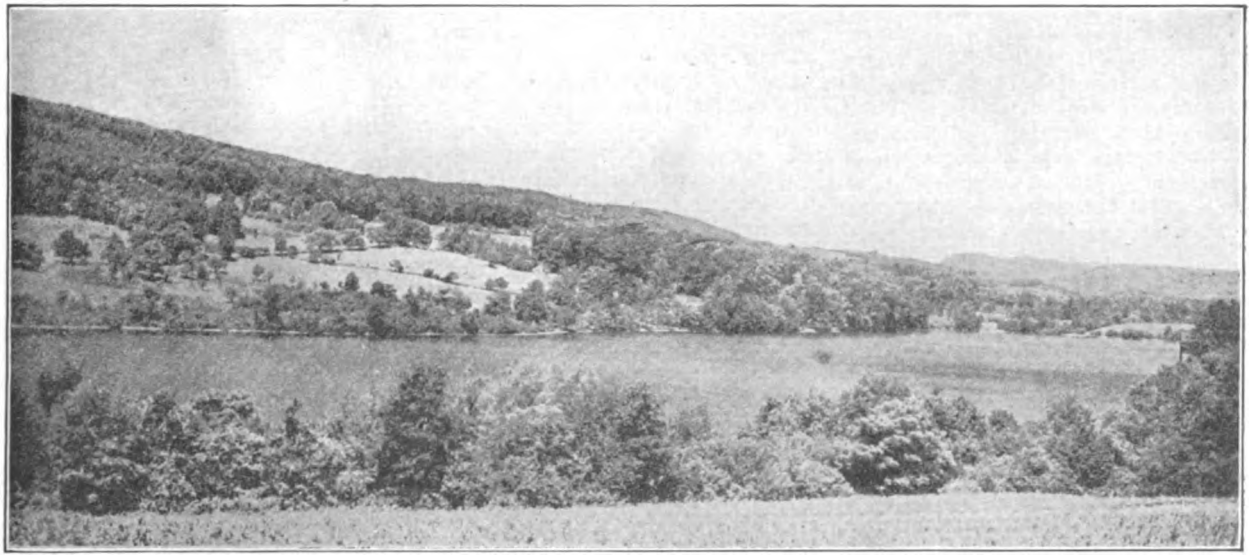
ENCIRCLING THE NEW ENGLAND STATES.

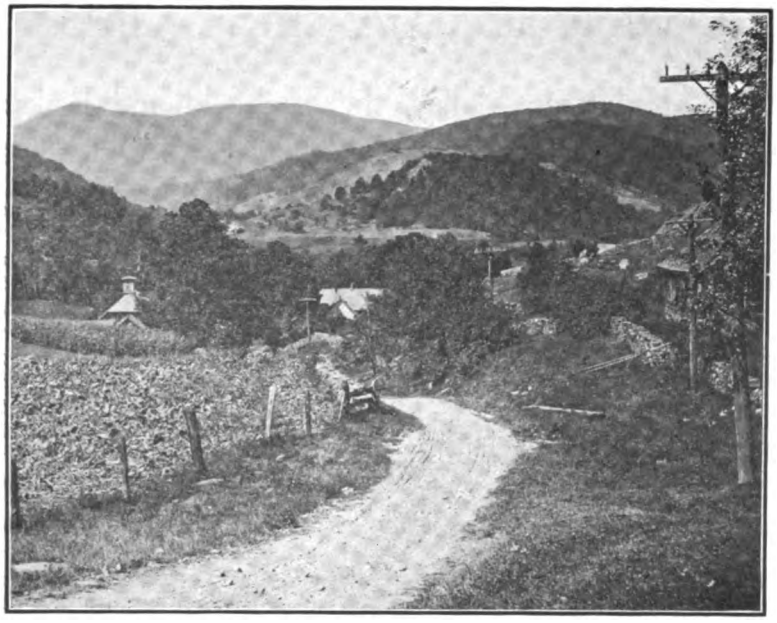
A Nine-Day Tour Through the Housatonic Valley, the Litchfield and Berkshire Hills, Green and White Mountains and Famous Rangeley Lake District.



IN NO other section of the country is it possible to combine so much that is rich in natural beauty and historic associations as in New England. While it may be regarded as the original touring ground of the American motorist, the charm of its mountains, lakes, rivers and valleys is such that visitors come again and again, apparently finding it impossible to exhaust its resources. It has proven the mecca for tourists from all parts of the Union, even from those sections noted for their scenic grandeur. A large proportion of those who come from a distance will find it desirable to enter this district through New York City, and this has impelled the preparation of an itinerary practically encircling the New England states, starting from and returning to that centre. Other tours will be listed herein, giving optional routes, and as each itinerary may be used in connection with any other the reader will be able to arrange his plans as best meets his wishes.

Leaving New York the first day, the route lies through the metropolitan residential suburbs of New Rochelle, Larchmont, Mamaroneck, Rye and Portchester to Greenwich, Conn., which, with its many splendid homes, is also a suburb of New York. At Stamford, a pretty little city with handsome drives, the tourist turns northward into the Litchfield foothills. Ridgefield is well known to New York people as a summer place. It gains its name because of a lofty ridge, called by the Indians Caudatowa. In May, 1777, a little band of militiamen here cost Gen. Tryon 170 men before he was able to capture the defense. On the way to Danbury, is to be seen the monument raised to Gen. Wooster, the commander of the Continental forces, by the Masons, who have a particular regard for his memory, because of the fact that he instituted the first lodge in the state, Hiram of New Haven.

Danbury is the home of the hat industry, the first American hat factory being located here in 1780, when Zadoc Benedict, with three men, was able to produce three hats a day. The town was destroyed by Gen. Tryon in his memorable raid of May, 1777, and with it a large quantity of army supplies stored there by the colonists. The road now makes a descent into the Housatonic valley.



At Brookfield, north of Danbury, hills, high and steep, characterize the landscape, and this condition continues for some distance. Above New Milford, the hills and mountain ranges recede from the river on either side, and the river bottoms broaden into the most delightful intervales and meadow lands. Beyond New Milford lies Kent, having all the dignity of a respectable New England village, besides a great deal of scenic beauty and fine natural situations that are not always found in connection with dignified and eminently respectable towns, even in New England.

West Cornwall is the gateway to a wild and picturesque region traversed by the Cornwall range. Curiously tumbled about, rocky and broken, are these mountains and they possess a charm all their own. Lime Rock is sufficiently suggestive of the region in its neighborhood, for here ledges of the whitest limestone, seamed with lines of gray and black, show gleaming in the sunlight, or as white and gray patches among the shadows of the woods.

Prospect Lake, One of the Pretty Little Sheets of Water That Dot the Berkshire Hills.

Digitized by Google

Pleasing Mountain Scenery in the Vicinity of Jamaica, Vt.

At Falls Village, the Housatonic takes a series of tumbles from a primeval rock dam, extending almost across the river bed, as a beginning of the descent, thence over a succession of natural terraces, alternating at no great distance, rushing and foaming and boiling among thickly strewn boulders, until it has fallen 130 feet. The falls not only form one of the most picturesque scenes on the whole trip, but furnish power for extensive manufacturing operations.

At Great Barrington, a side trip may be taken to Purgatory, a curious rock formation. Monument mountain is on the way to Stockbridge. On the east side is a white quartz cliff of considerable depth, detached from which is Pulpit rock. On the north side of the mountain is the Profile. A short distance beyond Stockbridge is Lake Mahkeenac, a beautiful calm sheet of water, surrounded by hills, with the village and spires of Curtisville peering over the trees toward the south.

Stockbridge and Lenox are known for the singular purity of their air. Many summer homes of wealthy people are located in this immediate vicinity, and add their beauty to that of nature. From Bald Head is gained a splendid view of the Berkshires and the well-known Housatonic valley.

Pittsfield, the Heart of the Berkshires, is the first night stop. It commands a view of the Lebanon valley which is unsurpassed. Balanced rock, near by, is one of the Berkshires' greatest natural curiosities. Its height is 18 feet and its estimated weight 150 tons. Resting upon one square foot of surface, this immense boulder is so evenly balanced that it may be swayed readily with a lever or by a man's weight. A number of interesting lakes are in this vicinity, including Pontoosuc, Ashley, Silver, Morewood and some others.

Pontoosuc lake is near Lanesboro, which is reached early on the second day. This town possesses beds of snow white granular quartz, used in the manufacture of superior cylinder glass. Variegated marble also is obtained here. Savage mountain and Constitution hill are picturesque heights a short distance away. Lanesboro was the birthplace of H. W. Shaw, known throughout the world as Josh Billings.

Midway between Mt. Greylock and Berlin mountain, is a pretty rural hamlet, South Williamstown, seat of the Greylock Institute for boys. Five miles further along is Williamstown, the reason for the existence of which is Williams College. The tour enters Vermont at Pownal, and approaches Bennington passing the famous battle monument on the way.

Beyond Arlington, the highway passes through the Sandgate notch, a remarkable cut in solid rock, 30 feet high, 800 long and 12 wide. Manchester is a quiet town at the base of Mt. Equinox. The sidewalks are of marble from the inexhaustible quarries on the mountains nearby. The route now enters a valley between the Green mountains on one side and the marble hills on the other, and slowly climbs up into the former. At Danby and beyond at Walling-

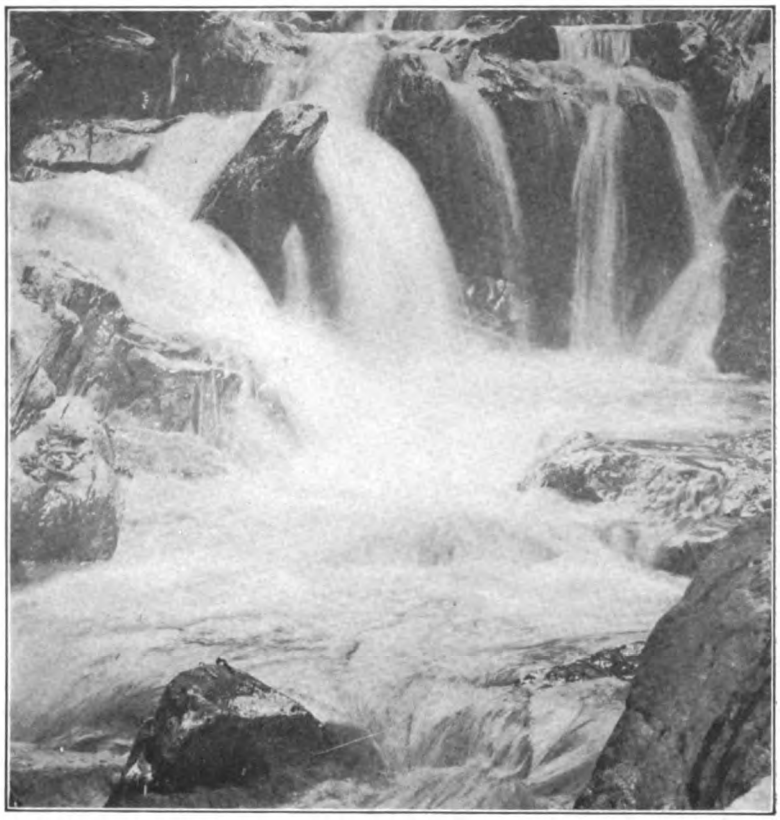
A Glimpse of the Mountains on the Way to Manchester, Vt.

Digitized by Google

ford the lofty ridge of White Rocks is reached. Clarendon is passed on the way to Rutland.

The principal marble quarries and sawmills are at West Rutland, whence immense quantities of white marble is shipped to all parts of the world. Large gangs of saws, without teeth and cutting by means of sand poured in from above, are constantly running. A little further along the tourist reaches Castleton, where there are extensive marble and slate quarries, and at which point an excellent imitation of marble is produced by coating the slate with marble deposit. Much of this stone is taken from quarries on the banks of Lake Bomoseen, a sheet of water eight miles long and from one to 2.5 in width.

At Hubbardton, an obelisk, near the Baptist church, marks the battlefield of July 7, 1777, soon after the evacuation of Fort Ticonderoga. Rich lake views are obtained from many points on the way past Lake Champlain, with glimpses of the Adirondacks in the distance. The night stop, as outlined, is at Burlington, the Queen City of Vermont. Here are several fine buildings, among them St. Paul's Episcopal church of blue limestone and with beautiful stained glass windows. The University of Vermont occupies a commanding position on a high hill, and near this is Green Mountain cemetery, in which lies the body of Ethan Allen, under a Tuscan column 42 feet high.



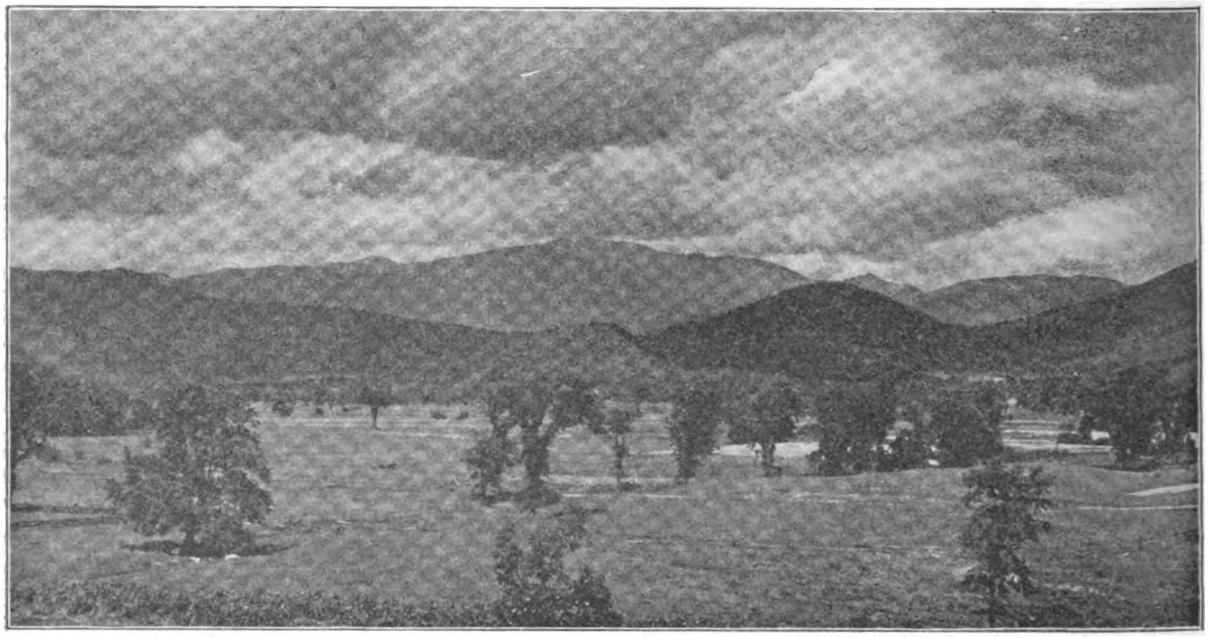
The way now leads along the valley of the Winooski river. Waterbury abounds with pleasant rambles and drives, with frequent glimpses of Camel's Hump and Mt. Washington, while Boston falls are near by. In the vicinity of Middlesex the river passes through a gorge 30 feet deep, 60 wide and 1300 long. Montpelier is the capital of the state and is situated on a plain near the river, surrounded by fertile farms. Under the portico of the State House are two cannons taken from the Hessians in the battle of Bennington in 1777, after a desperate struggle. The British got them back, but they were retaken by the Americans during the Canadian campaign and were presented to the state by Congress.

After leaving Montpelier, the route leads down into the valley of the Passumpsic, with its black, rock banks, which is crossed at St. Johnsbury. At the latter place considerable interest attaches to the works of the Fairbanks scales concern, particularly those which are made for use in Oriental countries, with their Chinese and Turkish numerals marked thereon.

From the hills in the vicinity of Littleton, N. H., may be had a fine panorama of the White mountains, and a little later the tourist enters the White mountain region at Bethlehem. No more beautiful view of the entire range can be secured from any other point. To the north and west are the mountains of Lancaster, the Percy peaks, the Pilot mountains and the great Presidential range. The night stop is at Bretton Woods, the very centre of the entire district.

The fourth day gives ample chance to test the car on mountain roads, but if additional trials are desired it is possible to connect with the road to the summit of Mt. Washington at Cherry Mountain or Gorham. For river scenery, combined with the impressive mountain forms, the vicinity of Gorham surpasses all the other districts from which the highest peaks are visible.

The drive to Gilead, Me., is along the river, with ever changing hill scenery on either hand. This continues through Mayville, North Bethel and Newry to Rumford Falls. Here the descent of the Androscoggin is over 150 feet in three or four plunges over ragged granite ledges. The third fall has a nearly perpendicular drop of over 70 feet, and its roaring is heard at a great distance.



View of Little River as It Tumbles Over Bolton Falls, Vermont.

From this point the route enters the Maine woods on the way to Rangeley lakes, passing through Mexico, Dixfield, Weld, Webb and Madrid. Many summer camps and once in a while a farm house serve to break up the monotony of the continual forest, of which there are nearly 100 square miles in this region. The trip is by no means uninteresting, however, for something new in the way of scenery is being spread out before the tourist all of the time. The

Digitized by Google

elevation of the lakes is about 2000 feet, and the pure air and sparkling water make it a most desirable spot in which to spend a summer's vacation.

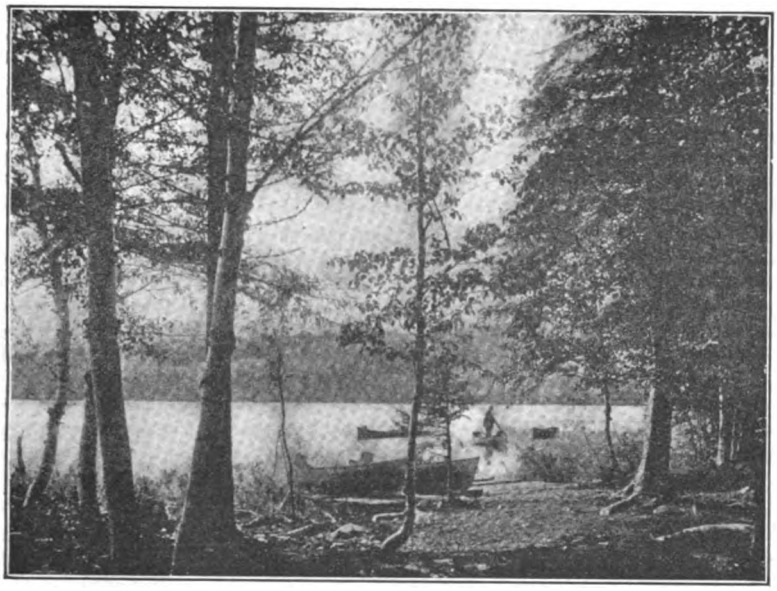
During the fifth day, the tourist has many more miles of Maine woods before him. The route from Rangeley lakes to Skowhegan, by way of Dead River, Green Farm, Stratton, Flagstaff, North New Portland and North Anson, is somewhat better known by automobilists than that over which the tour reached Rangeley. The scenery, still that of the woods, interspread with numerous ponds and lakes, is fully as inspiring as any to be seen in New England.

One of the Views of the White Mountains from Bethlehem, N. H.—Mt. Washington in the Distance.

After leaving Skowhegan, fine fishing country is visited on the way to Pittsfield and Newport, the latter town being located on the shores of East Pond, which is 15 miles in circumference and affords most excellent fishing. The night stop is at Bangor, in size the second city of the state, and the second lumber mart in the world. The approach to the city, by way of Etna, Carmel and Hermon, gives commanding views of the hills at head of navigation on the Penobscot. The tributaries of this river penetrate the great Maine forest in every direction, and bear downward to this city immense quantities of lumber, work on which may be seen at numerous places on the route.

The river is quite as picturesque below Bangor. During the war of 1812, the British attacked Hampden, plundered and overran the town for three days. Between Winterport and Frankfort may be seen the granite quarries around the base of Mt. Waldo. Belfast is a handsome little city built on a declivity which slopes to the water, with wide shady streets.

The route now passes along the Penobscot bay, with its views of Mt. Desert in the distance. Camden is a pretty little town, with the two Megunticook peaks and a number of other smaller mountains to complete a picturesque group. Hills continue to furnish the change of scenery through Rockport and Rockland, the latter situated on Owl's Head bay. Here ship building is carried on, but the chief industry is lime burning. The kilns should be seen at night, and make a splendid addition to the hill and marine scenery about the city.



Thomaston is located on a deep, narrow harbor, and is the site of the Maine state prison, established in 1824. This was the scene of a sharp naval battle in 1724, when a fleet of 24 vessels, composed for the most part of captured fishing boats, engaged the colonial relief ships, which were forced to retire, greatly damaged by the Indian artillery. The fort which was built in 1720 withstood all attacks and was still standing during the Revolution.

Warren, another ship building town, was settled by Scotch and Irish in 1736. Waldoboro was settled by 1500 Germans in 1753, and some of their descendants still remain. Woolwich was founded in 1638, its Indian name being Naquasset, but was depopulated by an attack in 1696. It was rebuilt in 1759. William Phips was born in this town in 1651, and was a shepherd on its rocky hills. Later he learned the art of ship carpentry and in 1687, he succeeded in locating a Spanish treasure ship near the Bahamas, recovering something like $1,500,000 worth of jewels and bars of gold and silver. For this he was knighted by the king and received $80,000 of the treasure.

Bath was once a wealthy city, until the decline in American commerce seriously affected its ship building industry. It has a fine harbor, rarely bothered with ice, and the Kennebec at this point is very beautiful. The river is half a mile wide, and is rapid and deep. Some of the best shipbuilding lumber is floated down from its head waters.

Brunswick is a prosperous town at the falls and the head of the tidewater on the Androscoggin.

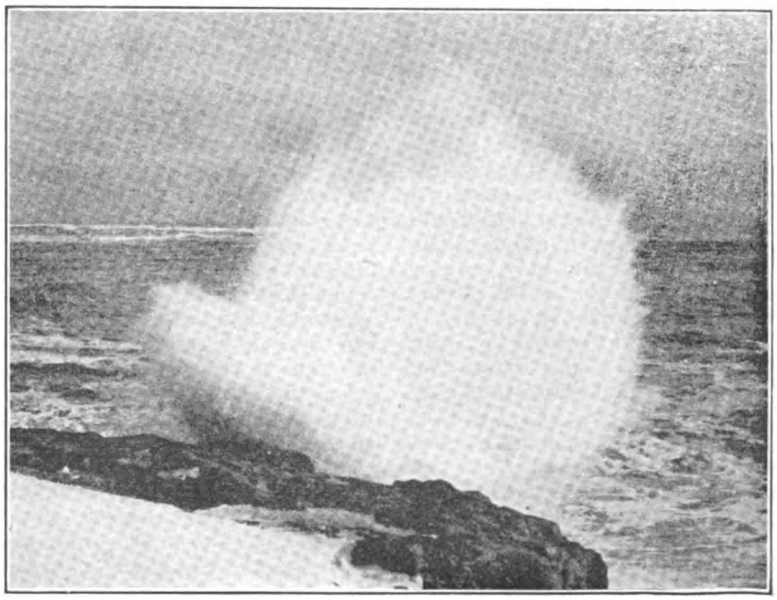
Digitized by Google

Loon Lake, One of the Small Bodies of Water in Rangeley Lake Region.

The river falls 41 feet in three pitches and furnishes power for numerous factories. The town is also the seat of Bowdoin College. The pine groves in the rear of the college buildings are widely known for their sombre beauty.

Portland is the night stop. The city is situated on a high peninsula at the southwest end of Casco bay. Its harbor is deep, well sheltered, and is defended by powerful forts, while its numerous islands afford favorite resorts during the summer season. Portland has been devastated by fire several times. It was burned by the Indians and British, and several large fires have destroyed portions of it since.

Near Biddeford, may be seen the ruins of Fort Mary, built in 1708. A quaint old house of the 17th century is also of interest. Between Saco and Kennebunk the tour crosses the Saco river, and at Biddeford may be seen the falls, which furnish power for a number of towns in that vicinity. Several of the famed Maine beaches are passed as the tourist proceeds on his way to Portsmouth, N. H.



This is a quaint and pleasant old city, with some very remarkable examples of colonial architecture. The old Church of St. John is worthy of a visit, as well as the Gov. Wentworth mansion at Little Harbor. This latter is a large, irregular building, dating from 1750, and contains the old provincial council chamber, as well as many quaint relics of the past.

The tour is arranged to visit the beaches in this immediate vicinity, all of which are famed for their beauties. The old chain bridge, three miles west of Newburyport, is the second suspension bridge in the world and the first in America. The Newburyport silver mines, which were opened in 1875 and for a time yielded richer ore than those of Nevada, are also near the city. Newbury was settled in 1635, and for many years was noted for the wealth and aristocracy of its residents.

Rowley is a town composed largely of salt marsh. It was settled in 1638 by a nomadic church, led by Ezekiel Rogers. In 1650, he died, leaving his library to Harvard College. The first cloth made in America was turned out by these early settlers. Ipswich was the home of Cotton Mather. The town was purchased from the Sagamore Masconmet for $100 in 1633 by John Winthrop, the first governor of Connecticut.

Wenham lake has a world-wide reputation for its ice, which is shipped to remote parts. This ice is kept entirely free from snow and is harvested when about a foot thick, yielding about 1000 tons to the acre. Beverly was known as the summer capital during the administration of former President Taft. Other North Shore towns passed on the way to Boston, are Salem, home of Salem witchcraft, with its witch's hill, the East India Marine Hall, Plumber Hall and other historic associations; Lynn, with its first shoe factory in America, its Dungeon rock, where pirates are said to have held sway, and the home of Molly Pitcher; Revere Beach, a favorite summer amusement park; Somerville, one of the richest suburbs of Boston; and Cambridge with its Harvard University, Washington elm and Longfellow's home.

Boston is filled with points of interest, but a bare mention of

Where the Surf Beats High at Popham Beach, Near Bath, Me.

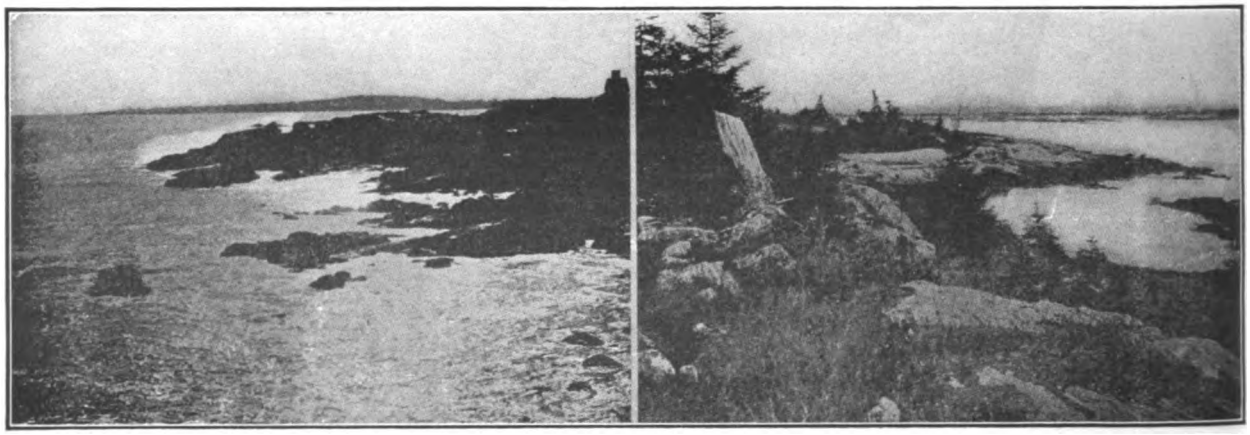
Digitized by Google

some of them will suffice. These would include the Old South church, Paul Revere's home, the old State House, Faneuil Hall, the Public Gardens, the library, the Christian Science church, the Museum of Fine Arts, and other equally famous buildings and places. From this city to Providence the way is over macadam for its entire distance.

The wide streets of Dedham are over-arched with handsome elms, and the sidewalks are fringed with arbor-vitae. Among the points of interest may be mentioned St. Paul's church, a handsome Gothic structure, and the ancient cemetery alongside it. The town has many old mansions in wide and pleasant grounds, and is considered by many as the most beautiful in eastern Massachusetts.

Brown University and others.

On the way to Apponaug, the tour passes Roger Williams park, given to the city by Betsy Williams, great-great-granddaughter of the man whose name it bears. It includes 100 acres of beautifully diversified land and the venerable gambrel roofed home of the donor. At Wickford may be seen the curious old square Episcopal church built in 1707, the block house erected for defense in 1641, and the rolling rock, where Roger Williams and Canonicus signed their compact.



This is all historic country, and recent discoveries in the hieroglyphics on some of the rocks proclaim that it was at this point Norsemen first landed to communicate with the Indians hundreds of years before the discovery of America by Columbus. On the way to Saunderstown are the ruins of the old Narragansett fort on the edge of the pine and cedar swamp.

Narragansett Pier is one of the best known shore resorts in the country. It is at the height of its glory during the touring season, when its many large hotels are filled with prominent people. Then comes Wakefield, Charlestown and Westerly, the latter the home of the Seventh Day Adventists. If the tourist happens to reach this town on Saturday, he will find little business going on and the church bells ringing.

Of Stonington it was once written that it "suffers in religion because of its nearness to Rhode Island." However true that may have been at that time, it certainly suffers nothing because of being pleasantly situated with a fine outlook upon Long Island sound. Its quiet streets are embellished here and there by iron relics of 1814.

Near Mystic, is Pequot hill, the scene of the battle between the allied English and Indian forces against the Pequots. Upon arriving at the Indian fort the allies of the English at first declined to aid in the attack and the colonists decided to make the attempt alone. As they were kneeling in prayer, the sachem Wequash was so impressed with the sight that he became converted and preached Christianity throughout New England until he suffered martyrdom.

New London is the last night stop and there are several points of interest in and about the city, among which may be mentioned the only house still standing,

Shore at Cliff Island, Casco Bay, Me. Sunrise at Cape Elisabeth, Portland Harbor.

Pawtucket, R. I., was the scene of the total destruction of Capt. Pierce and his 70 men in 1676. Surprised by the Indians he was driven back to the river by a shower of arrows, and when help came not one man was left. It is the home of the first cotton mill in the country, a building which is still standing and may be seen above the falls of the Blackstone river in the centre of the city.

Providence was settled by Roger Williams, after being driven out of Salem. The city abounds with memorials to him, and his body rests in North cemetery. There are many places of interest, includ the State House, with its handsome portrait of Washington; the ancient First Baptist church, founded by Roger Williams; the Athenaeum, with its wealth of fine paintings; and the buildings of

which was left by Benedict Arnold when he burned the town during the Revolution; the building in which Nathan Hale taught school, now standing near "Ye Anctientist Burying Ground," and others.

The way back to New York, the last day, is over the so-called shore line route, along the Long Island sound. Lyme is a venerable hamlet, buried in foliage, its main street lined with old trees and historic mansions. At Saybrook Point was an old fort, built in 1635, which was destroyed in 1871 in order that the railroad might be cut through. It was in a fair state of preservation, and its long history should have deserved for it a more noble end. The new bridge over the Connecticut river at Saybrook makes it unnecessary to utilize the ferry as was formerly the case.

Digitized by Google

Westbrook, Clinton and Madison are pretty summer shore resorts, still untouched by the trolley and lacking the noisy amusement parks of those nearer the Elm City. Guilford was the hiding place of the regicides for a time. Between Guilford and Madison is Sachem's Head, so named because during the extermination of the Pequots, Uncas, the Mohegan sachem, pursued and shot a Pequot chief, placing his head in the fork of an oak tree, where it remained for many years. Branford bay is dotted with the Thimble islands, on which many summer homes are located.

At New Haven the buildings of Yale University are of particular interest, and if time permits, the Art School and Peabody Museum of Natural History should be visited. The way then leads through several shore resorts of more than local importance, including Savin Rock and Woodmont, the latter being a borough and the first in Connecticut in which women had a vote for local officials. Bridgeport is termed the Park City, which is sufficient to indicate that time might profitably be spent in viewing some of its very fine park property. The outward route is reached at Stamford.

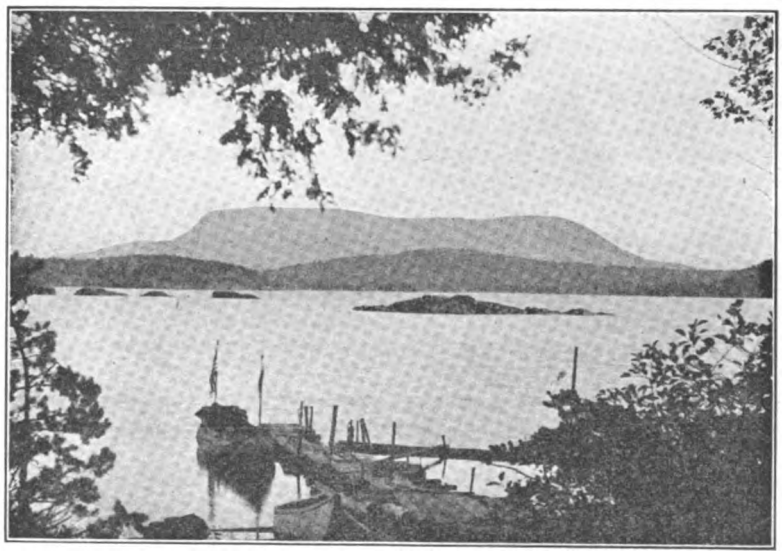
IN THE HEART OF THE MAINE WOODS.

Outlining a Week's Visit in Aroostook County and the Province of New Brunswick, with Return to Bangor by Way of the Coast and Washington County.

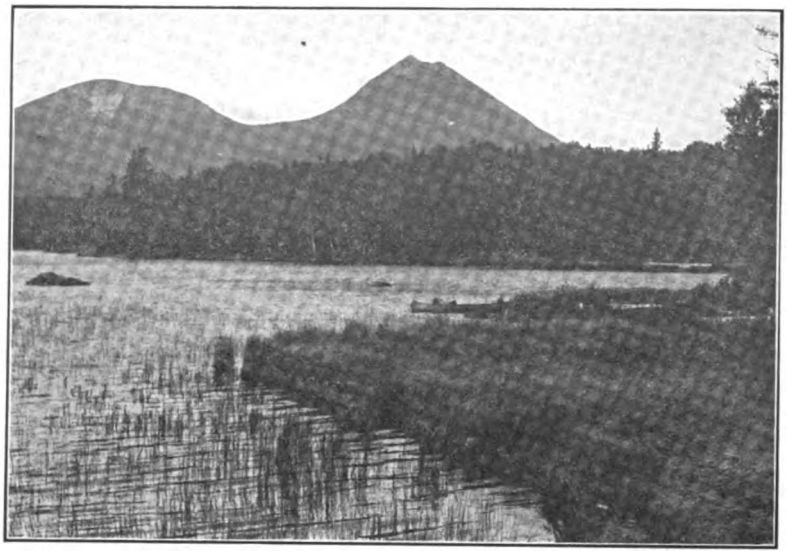
A FEW years ago Aroostook county, Maine, was an unknown wilderness. This applies in a measure to large portions of the district today, although the automobile has done much to overcome this, along the New Brunswick border. Not many sections of America, with the same population, area and conditions can muster more motor cars, and its roads are rapidly becoming such as to attract large numbers of tourists.



Beyond the fact that this is the very centre of the Maine woods, and that it is famed for the finest potatoes in the world, most motorists know little of Aroostook county. It follows from the above statement that not all of the district is covered with woods, although doubtless these virgin forests will have their appeal for the venturesome tourist. Fishing and hunting may be considered as ideal, and the entire section has been noted for years as a camping ground for vacationists.

Tour No. 2 is designed to occupy seven days, leaving from and returning to Bangor, from which point connection may be made with itinerary No. 1. This feature will appeal to many tourists from sections outside of New England, since it will be possible to add this trip to any of the others presented in this number. The night stops are at Houlton and Fort Kent, Me.; Woodstock, Fredericton and St. John, N. B., and Calais, Me. Of course, it is possible to return to Bangor over the outward route, if preferred, reducing the necessary time very materially.

The way leads from Bangor along the Penobscot river to Veazie, the surface of the river being covered with booms and immense rafts of timber, floated down from the Moosehead lake region and toward Mt. Katahdin, glimpses of which may be had from the distance. Accompanying the lumber in the river are the numerous saw mills along its banks. This is particularly true of Oldtown, but first, mention should be made of Orono, the seat of the State Agricultural College.



Oldtown is said to possess the largest lumber mill in the world, where over 100 saws are at work turning the rude logs, which come in at one side, into planks, these being rafted down the river to Bangor. On an island near the town is the home of the Tarratine Indians, one of the three tribes of the Etchemin nation. Although the most powerful and warlike of the northern tribes, the Tarratines rarely attacked the colonists. After a series of wrongs and insults, however, they visited the settlements and inflicted such terrible damage that Maine became tributary to them by the Peace of Casco. The treaty of 1726 contains the substance of their present relations with the state. They own the islands in the Penobscot, and have a revenue of some $7000 from the commonwealth. A ferry boat will take the tourist to their island home, and the visit is well worth while.

Leaving Oldtown, the route passes through a succession of thinly populated towns, Costigan, Olamon, Passadumkeag, Lincoln and Winn, to Mattawamkeag, a small village at the confluence of the Penobscot and Mattawamkeag rivers. Most of the inhabitants of these towns are engaged in lumbering. The last named village offers quite the best view of Mt. Katahdin, of volcanic origin, and Maine's chief claim to mountain scenery. From its rugged top may be seen all the lakes, rivers and woods of northern Maine, spread out like a map below. It

View of Spencer Mountain from Lobster Lake in Central Maine.

Digitized by Google

Mt. Katahdin, Maine's Highest Peak, as Seen from Kidney Pond.

is in the centre of the best moose country of the state, and a peak about which very little was known until quite recently.

From this point the tour passes through the heart of the Maine woods, abounding in spruce, cedar, hemlock, yellow and white birch, and maple. Splendid mills are to be found nearly all of the way, and particularly at Haynesville. Several important ponds are within easy access of the road, and the many streams throughout this district plunge on their way to the Atlantic over a succession of beautiful falls.

The night stop is at Houlton, the principal city of the county and noted for its beauty, its splendid homes and its hospitable people. Besides being engaged in the lumber business, Houlton is one of the principal markets for the famous Aroostook county potatoes. The soil in and about the city is wonderfully fertile, and the product is justly considered the finest in the world.

Presque Isle is the centre of the rich farming lands, which cover 500,000 acres. There also is good fishing and plenty of interesting scenery in the vicinity. Many Swedes have settled north of Presque Isle, as may be gathered from the name—New Sweden. Another extensive lumbering establishment is located at Van Buren, and lumbering also is carried on at Grand Isle. Madawaska was settled by the French, who were expelled from Arcadia in 1755. Twelve miles distant is New Fairfield, a famous starch centre.

Fort Kent, the second night stop, is the most northern town in the United States. It is located at the confluence of Fish river and the St. John. Five miles away is Eagle lake, and dozens of other handsome bodies of water are in the immediate vicinity. All of these, as well as the many streams, are filled with big, gamy trout, and many salmon are caught in their season.

The return trip follows the outward itinerary to Van Buren, thence across the border into Grand Falls, N. B. Still other descendants of the Arcadians will be found in this vicinity. Here also the St. John river is contracted into a narrow gorge between lofty cliffs and plunges over a succession of rocky steps, the first in the series being a sheer drop of 40 feet.

Woodstock, the third night stop, is the shire town of Carleton county, New Brunswick, and is pleasantly situated on the banks of St. John river, 150 miles from its mouth. From this point it is possible to connect with the outward route at Houlton, Me., if desired, but the tour as outlined contemplates a visit to St. John, the way leading down the valley, so far as practical, with splendid mountain and lake views on either side.

Fredericton is a small city, beautifully situated on the river, and distinguished because of being the political capital of the province. The Government house is a plain and dignified stone building in extensive grounds just north of the city, and the Parliament house is a modern structure near the deserted barracks. The

Grand Falls, Webster Stream, One of Many Cataracts in Northern Maine.

Digitized by Google

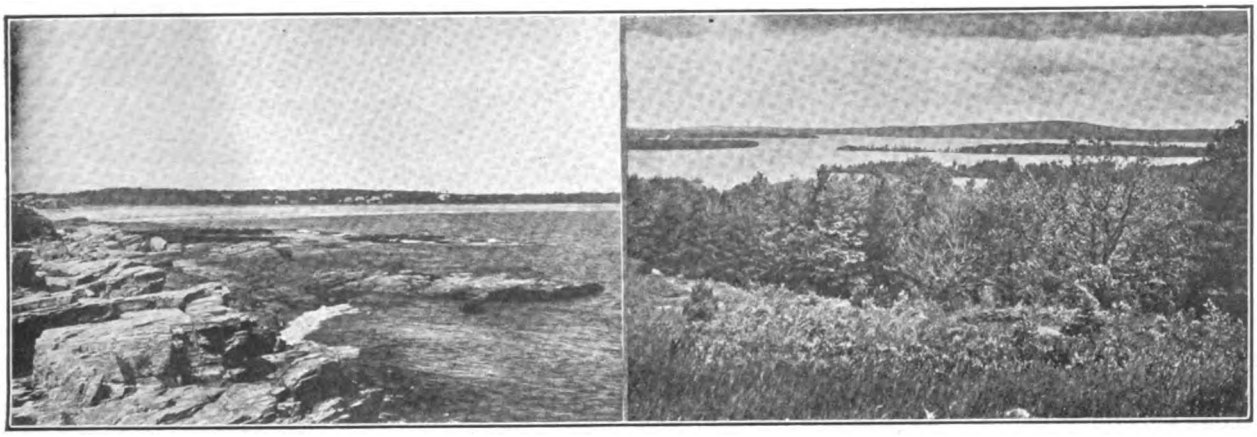
University of New Brunswick has fine buildings on a commanding hill near the city.

From this point the St. John river is very picturesque, and a number of other streams empty into it at various points, adding to the charm. The way is very nearly all down grade. Numerous islands are passed, and the road crosses many rich intervales. At one or two places may be seen abandoned forts, which were the centre of long sieges 200 or 250 years ago. Just before reaching St. John the river enters a narrow channel between palisades, and below is the suspension bridge over the famous reversing falls. The tides in the Bay of Fundy are well known throughout the world, and these falls, over which the river dashes through a narrow gorge at low tide, have the appearance of flowing up hill as the tide rushes upward through the gorge far above the river level.

St. John is the metropolis of the province and it is possible to make connection here for a number of pleasant trips through Nova Scotia, across the bay. Ample time should be available to take advantage of many interesting drives about the city, particularly that to the heights of Carleton; over Marsh bridge to Red Head, or to the cemetery and Loch Lomond.

The return trip to St. Stephen and Calais is along the coast, with splendid views all of the way. This is known as the St. George road, but care should be taken at Lepreaux that this old way is not followed between that town and St. George, unless the construction work begun last year is sufficiently well advanced to permit of its use. The longer route outlined is the main line taken by most tourists from the provinces to the States, although the new road, when completed, will save a number of miles.

Calais, the night stop, is well known as the border town. The people of Calais and those of St. Stephen, across the river, in New Brunswick, always have lived on the most fraternal terms. They formed and kept a compact not to engage in the war of 1812. It is possible to make this region the basis for an extended stay in eastern Maine, spending some time about the Grand lakes, and a pretty little side trip to Eastport may be taken if desired.



Dennysville is a picturesque country village on the shore of the Dennys river, which flows between high banks wooded with evergreens and through gorges with rocky sides. Marion is in the heart of a splendid partridge country. Deer are also plentiful in this section. At East Machias may be seen one of the oldest Masonic lodge rooms in the country, the lodge having been instituted Sept. 10, 1779.

Machias is an historic old town, noted for its many business enterprises. The town is located on both sides of the Machias river at tidewater, and up this river, reached either by canoe or automobile, are numerous lakes, and a hunting and fishing territory embracing over 300,000 acres. Harrington, one of the prettiest little villages in Washington county, has a number of desirable drives along the bay. Cherryfield, attractively situated on the picturesque Narraguagus river, is in the midst of several noted fishing ponds, and many well known woodcock covers are near here. The way next leads along the coast with its many indentations, and consequent fine marine views, through Steuben, Gouldsboro, etc., to Ellsworth, where connection may be made with Mt. Desert Isle and Bar Harbor, if the Town of Eden has at last decided to admit automobiles.

It may be added in this connection that there is a much shorter route from Calais to Bangor, this running in almost a straight line between the two cities and covering a distance of practically 99 miles. The road is somewhat rough, however, grass growing between the wheel tracks in many places. The country is of particular interest because of the virgin forests, and many excellent views are to be obtained.

Wesley is the first town of prominence to be reached, and is noted for the number of bears which have been shot within its confines. It does not follow that the tourist will see a bear if he takes this route, although he is pretty certain to find the woods well filled with deer in the immediate vicinity.

The covers about Beddington, 22 miles from Calais, are particularly well supplied with partridges, and there are a number of splendid camping sites to be found readily. Connection may be made here with the main route outlined, the distance between Beddington and Cherryfield being about 20 miles.

Inspiring Shore Scene Near Scarboro, Me. **One of the Fishing Lakes in Eastern Maine.**

MOUNTAIN LAKES OF NEW HAMPSHIRE.

First Day's Route Follows Closely That Taken by Paul Revere—Tour Furnishes Rich Scenic Beauties with Views of White Mountains in the Distance.

TOUR No. 11 has Boston for its starting point, and is suggested to cover three days, with night stops at Keene and Plymouth, N. H. Like all the itineraries listed in this number, it is possible, through connections at various points, to extend the vacation very materially if desired. The route covers much interesting country, particularly in southern New Hampshire, and many pleasing views of the White mountains are to be obtained at various points. Several very pretty lakes are within easy access by motor car, and all told the itinerary should prove especially attractive to those in search of a short tour among the lesser New England hills.

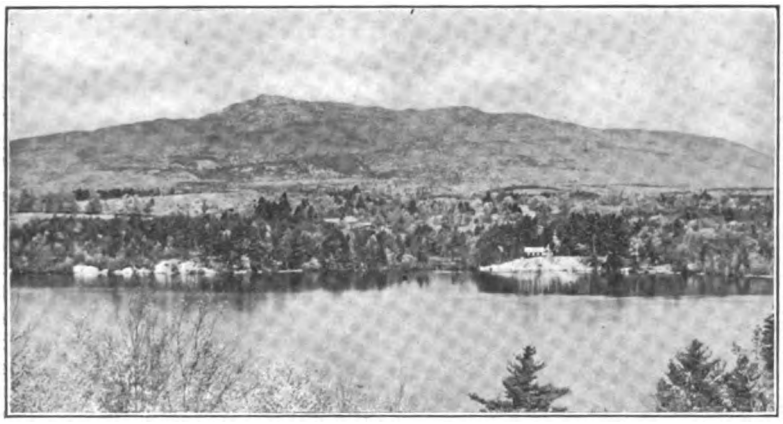
Leaving Boston by way of Cambridge, Arlington and Lexington, the motorist follows closely the road covered by Paul Revere on his famous midnight ride. At numerous points on the way monuments have been erected setting forth the progress of that trip as well as other interesting historical data connected with the Revolutionary period.

Groton was visited in 1646 by the sachem Monoco at the head of 400 Indians, and the town burned, with the exception of four garrison houses, in which the people successfully defended themselves. Monoco boasted that he was on his way to Concord and Lexington to reduce these towns, and later would march upon Boston. The following year saw him in Boston, but with a rope around his neck, marching toward the Common, where he was hanged.

The way then leads across country to Ashby and over the border into Keene, N. H., through the pretty little New Hampshire towns of East and West Rindge, East Jaffrey, Jaffrey and Marlboro. In the northwestern part of Jaffrey is Monadnock mountain, with its high and rugged top rising 3186 feet above the sea. In this town, also, may be seen the ancient church, now secularized, which was erected on the day of the battle of Bunker Hill. Workmen thereon are said to have heard the cannonading. Numerous drives about the lakes in this region are worth taking, if time be available.

Keene is a pleasant city in the valley of the Ashuelot river. Its original name was Upper Ashuelot, and signified "the collection of many waters." Two miles north of the city are the Beaver Brook falls, where the brook flows over a stair-like succession of ledges 40 feet into a deep pool.

The second day finds the tourist approaching Lake Sunapee, 1104 feet above sea level, and nestling among the hills of Sullivan and Merrimac counties. The lake is about 10 miles long, indented with enticing bays and coves, and ranges from one-half to three miles in width. A short distance from its shores is the majestic Mt. Sunapee, which adds not a little to the beauty of the scenery. Connections may be made here with tour No. 21 for a visit to the White mountains, rejoining this itinerary at Plymouth.



Lake Sunapee, N. H., in the Midst of Romantic Scenery and the Home of Gamy Bass.

Skirting this body of water by way of Newport, Guild, Sunapee and New London, the route lies toward the White mountains, with ever changing glimpses of the peaks in the distance. Entering the Pemigewasset valley, and passing Bristol, two miles further along, is Newfound lake, with Sugar Loaf mountain on the west shore and Crosby mountain on the east.

Plymouth, the night stop, is within easy view of the Franconia and White mountains to the north.

Digitized by Google

The Beautiful Contoocook Lake, Near East Jaffrey, N. H.

Mt. Prospect, 2072 feet high, is a little to the northeast. It possesses a number of interesting features, notably the Miser's cave, the Avalanche, the Cold and the Boiling springs. Oscela and White Face are toward the northeast, and just below Squam range to the east, is Squam lake, island dotted and very pretty. This is only a partial list of the lakes and mountains to be seen from Plymouth, most of which are located within a few miles' drive.

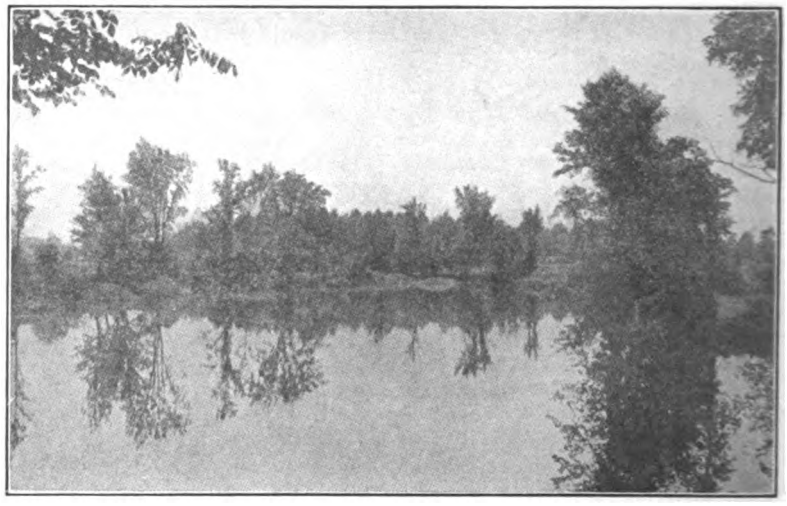
Connection may be made here with tour No. 12, which may be followed in the reverse direction to Bethlehem and thence to the Bretton Woods, or as planned, reaching the White mountain region at Conway and visiting the Maine woods, returning to Boston by way of Portland.

The third day visits Meredith on the way to Lake Winnipesaukee and The Weirs. Near the latter, on the banks of the lake, is Endicott rock, which is about 20 feet around, and on which are carved the initials of the chiefs of the Colonial survey of 1652, and with the words, "John Endicut, Gov." The waters of the lake reflect the shadows of several bold mountains and surround nearly 300 islands, large and small.

The Weirs is best known as a summering place, but at this point is located a large flood gate, so arranged that the flow of the waters from the lake into the Merrimac river, is controlled for manufacturing purposes throughout the entire Merrimac valley to Newburyport, Mass. The return to Boston is through this valley as far as Lowell.

Franklin was the birthplace of Daniel Webster. Concord is the capital of the state, and an abundance of shade trees gives it a pleasant embowered appearance. A splendid view may be obtained from the dome of the State House, and a number of the public buildings are worthy of attention.

At Manchester, the Amoskeag falls on the Merrimac river have a descent of 47 feet, with rapids above, and afford a fine sight. A short distance from this city is Lake Massabesic, which has 31 miles of shore with some beaches of remarkably white sand. The Fairy Cave and a curious sulphur cave, Devil's Den, are often visited by tourists, while in this vicinity. Nashua is the last New Hampshire town to be visited, and at this point may be seen some of the largest carpet mills in America. The water power is taken from Mine falls on the Nashua river, pleasing views of which are to be noted from time to time as the tour progresses. The Pawtucket falls, at Lowell, were a favorite fishing ground of the Indians. The Pawtucket canal extends from the head of the falls to the Concord river, below the city, and affords excellent water power, having a fall of 30 feet.



The outward route is rejoined at Arlington, after passing through Billerica and Burlington, although there are numerous methods of reaching the centre of the city from this point, practically all of them over excellent macadam roads.

THE WONDERS OF DIXVILLE NOTCH.

Itinerary Includes the Northern Portion of the White Mountain Region and Affords Splendid Opportunity for Scenic Grandeurs.

TOUR No. 12 is planned to start from Augusta, Me., and visits the White mountains. It is suggested as another three-day vacation, but can be continued indefinitely, by combination with other tours at various points on the way. The night stops are at Dixville Notch and Center Harbor, N. H., while a very pleasing alternative may be obtained by joining tour No. 11 at Plymouth, N. H., for Boston. The entire journey from Augusta to Boston by both of these outlines used in combination could be made to occupy not more than five days, if desired, and would afford a fine vacation.

Leaving Augusta on the first day, the tour visits the Belgrade lakes, without doubt the finest bass fishing grounds in the country. The water of the lakes is very clear and the bottom decidedly rocky, making an ideal haunt for bass. The shores of both lakes are well wooded and some excellent views are to be obtained along the roads skirting their edges.

The itinerary as outlined leads into the Maine woods in the vicinity of the Rangeley lakes, through Hanover, Newry, Grafton Notch and Upton, into New Hampshire at Errol. On the way several lakes are passed, included among which are: Mollychunkamunk, Allegundabagog, Welocksebacook and Umbagog, the last named at Upton.

At Errol, the tourist finds himself in the heart of the White mountains. On every side, there are to be found signs of nature's handiwork on the way to Dixville Notch. Among these may be mentioned Table rock, reached from the road by a rude stairway of stone blocks known as Jacob's Ladder. The view is very extensive from this point, and amply repays for the strenuous climb. The rock is 561 feet above the road, 2450 above the sea and is a narrow pinnacle only about eight feet wide at the top, with sharp, precipitous sides.

The notch itself, has high col-

Digitized by Google

View in the Flume at Dixville Notch in New Hampshire.

umnar sides, frowning at each other across the narrow chasm. These cliffs of decaying mica slate present a scene of ruin, transition and shattered strength, that is mournful and almost repulsive. The Notch is not a mountain pass, but a wonderful ravine among high hills. It has its flume, its cascades, its profiles, its snow cave, and its cold springs of the purest water known to science. Altogether it is a sight not to be missed, and well worth the climbing to which the car is subjected in reaching it.

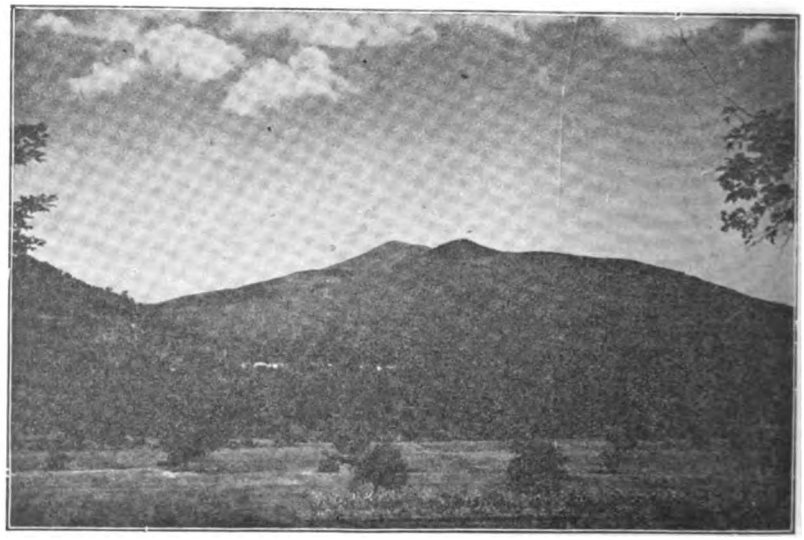
The second day, the tourist again passes through this two miles of palisades on his way to Colebrook, where a detour may be made to Connecticut lake, at the head of the Connecticut river, down the valley which he will drive through for a time. At Littleton, connection may be made with itinerary No. 1, which may be taken in either direction.

This tour now enters the Franconia range, scarcely less grand than that which was left behind so recently, and divided from it by the Twin Mountain and Field Willing ranges. The Franconia region has two great natural wonders, either of which would make any other section famous. Twelve hundred feet above the lake, starting out from the blue crest of the mountain, stands a sculptured likeness of a giant Titan; the profile of the Old Man of the Mountain. The Flume, located some miles below, is a rock fissure 700 feet long and 60 deep, with fern decked granite walls from 10 to 20 feet apart; in reality a miniature canyon.

Continuing to Plymouth, where connection may be made with tour No. 11 for Boston, this tour turns eastward to Center Harbor, on Lake Winnipesaukee, for the night stop. The next morning, the journey will take the tourist up the eastern side of the White mountains, affording still more wonderful views. Chief among these is that of Mt. Chocorua with the lake of the same name near its base.

At Conway the route leads away from the White mountain district and re-enters Maine at Fryeburg. A little later it visits the region of Lake Sebago and the well known resort at Poland Spring. Auburn and Lewiston, separated only by the Androscoggin river, are the last cities of importance passed on the way to Augusta. Lewiston falls, where the river breaks over a ledge of blackened gneiss, is worthy of note at this point. Lewiston is also the seat of Bates College, with its commodious buildings.

Near Winthrop is Lake Maranocook, the chief picnic ground of central Maine, It is a lovely winding lake, nine miles long, and about one mile wide, dotted with picturesque islands. West of the village is Mt. Pisgah, from which views of the White mountains are obtained.



At Augusta is located the recently rebuilt Capitol, and also the State Hospital for the Insane.

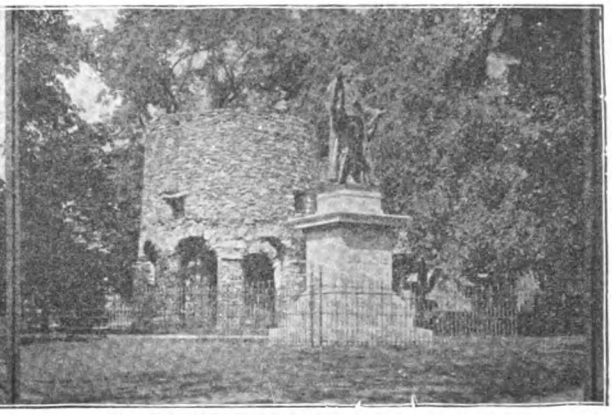
NEW ENGLAND'S MOST HISTORIC SECTION.



Along the South Shore to Plymouth and Provincetown, the Land of the Pilgrims, and Return to Boston by Way of Newport, the Home of the Norsemen.

TOUR No. 13 offers a decided change from those heretofore outlined. Like them it is planned to occupy three days, and is so arranged that it may be utilized in combination with any of the others presented herewith. It starts from Boston, and Provincetown, Mass., and Newport, R. I., are the night stops. The tourist returning from the Maine woods by itinerary No. 1 may enter upon this tour at Boston, rejoining his original schedule at Narragansett Pier, R. I., by ferrying across the lower end of Narragansett bay from Newport. It will add at least two days more to the trip, but it will be found to be time very well spent.

The route lies along the south shore from Boston, through Quincy, Hingham, Cohasset and Kingston, all filled with summer homes of Boston people, to historic Plymouth. In fact the entire trip during the first day from this point is over historic ground. At Plymouth, the tourist will wish to see Forefathers Rock, on which it is said that the Pilgrims first set foot in making their landing in America; Burying Hill, with its graves of Miles Standish, John and Priscilla Alden, and others only a little less known; Pilgrim Hall, with its museum of Pilgrim relics; the plot of ground where the dead were buried during that first winter, and their graves sown with grain the next spring to keep the Indians in ignorance of their death, and many other noted scenes. The sites of interest to the tourist are clearly marked, and it is possible to determine with a fair degree of accuracy just where each of the central figures lived and moved during those early days which followed closely the year 1620.

"The Breakers" at Newport's Summer Colony.

Historic Old Stone Mill in Truro Park, Newport.

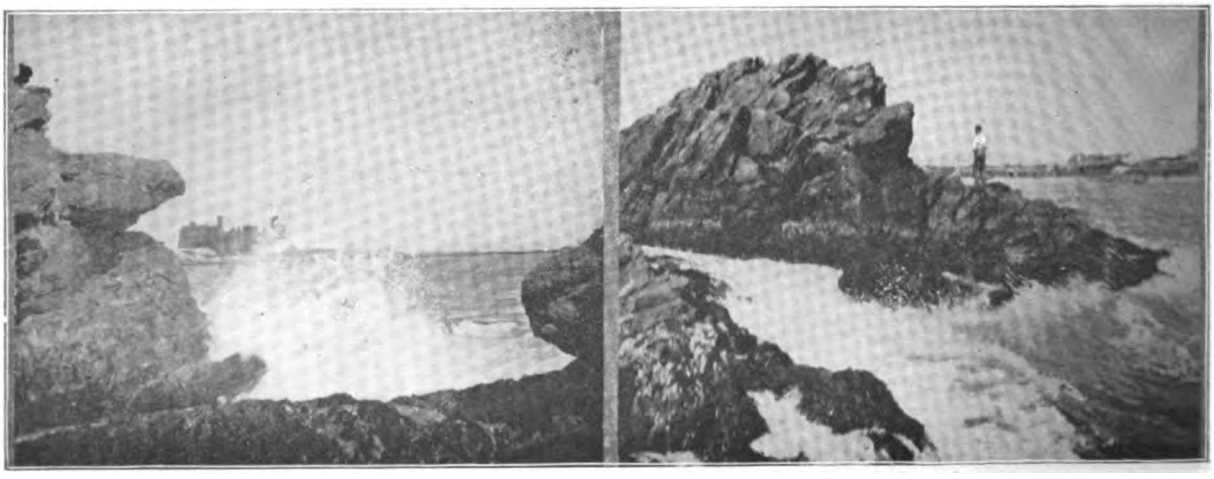
Seaconnet Point and Light in Southeastern Rhode Island.

The route lies along the north shore of Cape Cod, through a number of small towns, distinctive in their original quaintness, to Provincetown, in the harbor of which the Mayflower was brought to anchor, while the members of the little band drew up their compact and signed it with their life's blood. The tourist goes over the route in the reverse direction from that in which the Mayflower sailed from Provincetown to Plymouth, but after a night on the tip end of Cape Cod he returns over a portion of the trip, before shifting to the south shore.

From Chatham to Onset, the tour visits a number of towns, which have furnished numerous sailors for America's merchant marine, as well as the navy. Cape Cod has an individuality unlike that of any other section of the country. Connection may be made for Wood's Hole and Martha's Vineyard at West Falmouth. Buzzard's Bay is well known as the summer home of the late Grover Cleveland, while President.



Fairhaven was the home of the late H. H. Rogers, and the very excellent highways of the town practically were a gift from him. For years he was superintendent of streets in Fairhaven, but many times the salary voted by the town was expended by Mr. Rogers in giving to that section permanent highways, which will serve long as a memorial to him.

New Bedford and Fall River are large commercial centres in southeastern Massachusetts, the former having been for a number of years the home port of an extensive whaling fleet. The latter has an excellent harbor, and the numerous streams emptying into it afford abundant water power for numerous manufacturing enterprises.

Newport is reached by the way of Tiverton and along the island of Rhode Island. It is famed the world over for its magnificent summer homes of wealthy people. Opportunity should be taken to visit a number of these. The cliff walk, leading for several miles along the shore and through many of the estates, is also of interest. Aside from the summer homes, Newport has much of historical value, and among these features may be mentioned the Old Stone Mill, found standing on the highest point in the city when the settlers first cleared away the underbrush, and supposed to have been erected by the Norsemen, hundreds of years before the visit of Columbus to America. The United States naval training station, navy yard and torpedo station also are located at Newport.

The third day finds the tourist skirting the east shore of Narragansett bay, after crossing from the island of Rhode Island to Bristol by ferry. From Bristol may be seen Mt. Hope, where King Philip congregated his anti-English allies for the attack upon the Narragansett fort in 1675.

Itinerary No. 1 is reached at Providence, over which the return to Boston may be made, if

Digitized by Google

desired. This tour follows the Blackstone valley to Worcester, Mass., and re-enters Boston over one of the three main macadam routes between those two cities. Good roads are encountered practically all of the way from Providence, the beautiful Blackstone valley being ideal touring ground.

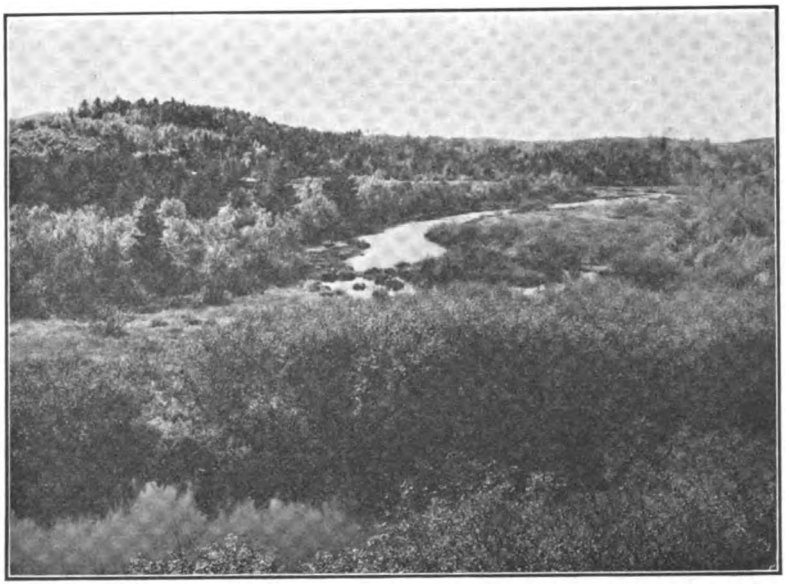
TOURING AMONG THE BERKSHIRE HILLS.

Itinerary Gives Two Routes Between Boston and Albany, Affording Connection with New England from the West---Particularly Attractive in the Autumn.



THOSE who enjoy the beauties of touring in the autumn, with all the kaleidoscopic colorings in the foliage of hill and dale, will appreciate the itinerary outlined herein. It is designed to connect Boston and Albany over two distinct routes, one of which, the outward trip, offers some slight deviations from the beaten path, while the other presents some of the best roads in the country in combination with many rich views of the Berkshires and the Connecticut valley. It is anticipated that the tourist will be on the road four days, with night stops at Greenfield, Mass.; Albany, N. Y., and Springfield, Mass.

After passing through Watertown, the site of the Massachusetts arsenal, and Waltham, the home of the Waltham watch, the tourist enjoys a pleasant drive through Maynard and Stow, and emerges from this first glimpse of country beauty to visit Fitchburg, another manufacturing city of importance. At Gardner is the largest chair factory in the world. Excellent automobile roads lead through Otter River, Baldwinsville and Athol to Orange, and then the descent into the Connecticut valley is begun. At Millers Falls, Mt. Toby and its base, and Lake Pleasant divide attention with the river. Greenfield is the night stop.

Soon after leaving Greenfield, the second day, the way leads up Shelburne mountain, and then into the valley of the Deerfield at Shelburne Falls, the early home of William Cullen Bryant, Charles Dudley Warner and several other people of note. At Charlemont, a view of the $20,000,000 Hoosac tunnel is obtained, and while the shorter distance to North Adams is over Hoosac mountain, a detour is made at this point, entering Vermont, through most interesting scenery, albeit, the roads are far from ideal in places. It is anticipated, however, that the tourist will find less difficulty in covering these country ways than in climbing the mountain and descending the many winding curves and heavy grades on the other side.

North Adams is in the shadow of Mt. Greylock, and about a mile north of the city is the famous natural bridge over Hudson's brook. The cascade in Notch brook is another pretty little spot half hidden away in a glen. After leaving Williamstown, the seat of Williams College, the way leads back into Vermont, through Pow-

Digitized by Google

The Otter River Meadows in the Vicinity of Otter River, Mass.

nal, and thence into New York state at North Petersburg, passing near Walloomsac, where was fought the battle of Bennington. A few country villages, with their quaint old houses are next passed, and the road descends into the valley of the Hudson on the way to Troy and Albany.

Albany, the capital of New York, is full of interest. Chief among the buildings of prominece is the state house, built at an enormous cost and filled with relics of all the wars. Two other structures of note are the Catholic and Episcopal cathedrals. Van Rensselaer Manor House and its park, on the site first occupied by Kilian Van Rensselaer, Patroon of Beverwyk, also should be visited for its historic associations.

On the return trip the road leads over the hills to Pittsfield, passing through the Lebanons, a series of Shaker settlements. Pittsfield is admirably situated among the Berkshires, with a number of little lakes and several interesting mountains nearby. Lenox is described as "a gem among the mountains," and is the summer home of numerous people of prominence.

Lee was settled in 1760, and was named for one of the Virginia Lees. It is famed for its wonderful white marble, of which some $1,000,000 worth was employed in the erection of the capitol at Washington. Becket has several lakes, from one of which the Farmington river flows down into Connecticut. The route to Becket is over the famous Jacob's Ladder, now placed in excellent condition, through agitation aroused by motorists.

Chester, Huntington and Russell are all pretty Berkshire towns, and then the way dips down into the Connecticut valley, through the Indian domain of Woronoco, settled in 1660 by the English and called Streamfield. The Little River water works of the City of Springfield are near this town.

Late in King Philip's war the people of Westfield were ordered to evacuate and concentrate with those of the other settlements in the valley at Springfield and Hadley. An angry refusal was returned and for a time negotiations were under way looking toward a union with Connecticut. Later the legislature found it desirable to cancel the order.

Springfield, the night stop, is known as the City of Homes. It is a centre from which a number of motoring trips may be made in all directions. From the United States armory on State street it is possible to secure a view up and down the valley, which is unequalled anywhere in this country, and which is considered by many to be superior to the like views afforded in European countries.

From Springfield to Boston the road is macadam nearly all the way. Palmer also is famous for its scenery, combining woods and hills, the lesser mountains, lakes and rivers. Warren is a pretty manufacturing town amid rounding hills. Of West Brookfield it is stated that it produces apples and boots, and the orchards are of

Lake Pontoosuc, Favorite Berkshire Picnic Resort at Pittsfield, Mass.

Digitized by Google

particular interest in the fall of the year.

In Brookfield time should be taken to visit the garrison house, in which for three days the settlers held out against a superior force of Indians. As a last resort the redskins backed a load of blazing flax and straw near it in an effort to burn it down. A sudden shower put out the flames, and the incident was regarded by both sides to the conflict as miraculous.

Spencer was the native town of Elias Howe, Jr., the inventor of the sewing machine. Then comes Worcester, the Heart of the Commonwealth, well and favorably known by motorists. The remainder of the distance into Boston is through Shrewsbury, Northboro, Marlboro (the so-called "boro" towns), Wayland and Weston.

Shrewsbury was the birthplace of Levi Pease, who started the first line of mail stages between Boston and New York in 1784, previous to which fortnightly mail was carried between these two cities in saddle bags. Northboro is devoted to cattle raising. Marlboro was the site of the Christian Indian village of Okammakemesitt. Each is filled with particular interest to the tourist.

In every respect this itinerary offers an ideal autumn tour. The Berkshires are at their very best during this season, and the two routes through them leave nothing to be desired. For those who have ample time at their disposal it would be possible to make North Adams, Pittsfield or Becket the headquarters for a more extended stay in their environs, with plenty of opportunity to enjoy nature at its prettiest.

VACATION SPOTS ON LONG ISLAND.

Tour First Visits Litchfield Hills and Housatonic Valley and Contemplates a Whole Day Among the Beauties of the Island Before Returning to Hartford.

FAMED as are the mountains, lakes and rivers of New England, it must not be denied there are numerous vacation spots in these states that are not so well known as their beauty would warrant. The same will hold true with respect to Long Island. And while this latter ground is more or less familiar to tourists from New York City, there are many motorists who have never taken the time to explore its resources.

In the accompanying itinerary, it is anticipated that three days will be devoted among the lesser known portions of this section. The start is made from Hartford, Conn., and the tour first reaches the Litchfield hills, and crosses Long Island sound for a day on the island itself, before returning to the capital of the Nutmeg State over ways perhaps somewhat better known.

Interesting Connecticut Touring Ground: At Left, Among the Litchfield Foothills; Centre, Washington Street, Hartford; at Right, in the Naugatuck Valley Near Thomaston.

Leaving Hartford, Farmington is the first interesting place reached. The town occupies a beautiful situation on the banks of the river of the same name. A broad and shaded street two miles long, practically composes the village. It was settled in 1640, and it was here that the village pastor preached to the Continental army on its march to Boston in 1775.

Plainville, with its macadam ways, Forestville, and Bristol follow in quick succession. The tourist is now in the centre of the original clock making industry in America. Eli Terry began the manufacture of these goods in a small shop in Terryville, but the business very soon spread to Bristol and Thomaston, both of which have been producing clocks for many years. Just before reaching the latter town, the route leads down a very steep hill, practically one mile long, although a detour may be taken if deemed advisable.

Northfield is a knife making centre, much of the cutlery being hand forged; the material is imported steel from Sheffield, Eng., whence many of the employees came. The road from this point to Litchfield is nearly all upgrade, and as the hills are climbed new scenes unfold themselves in rapid succession, and while the so-called mountains are small of stature the car finds much less difficulty in making the grades than would be the case in other portions of the chain.

Litchfield occupies an interesting place in history. The first law school in America was opened in a small building which is shown visitors with justifiable pride. During the summer months, the hill top is the favorite home for many New York people, and Bantam lake, only a few miles distant, and distinctly visible from many points, lends an added charm.

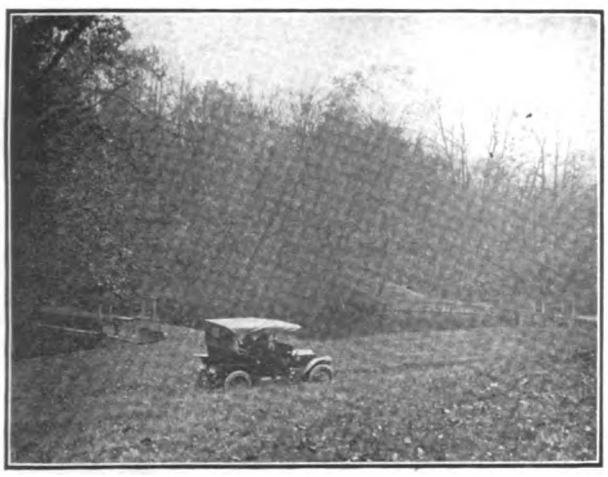
This lake is passed on the way to Bantam and New Preston. Just beyond the former town the road takes a dip between two high hills, one of which is known locally as Mt. Tom. New Preston commands a pleasing view of the surrounding country and easily explains the attractiveness of the section. Here, time should be taken to drive about Lake Warramaug, a splendid boulevard making this possible without difficulty.

New Milford is near the junction of the Housatonic and Aspe-

Digitized by Google

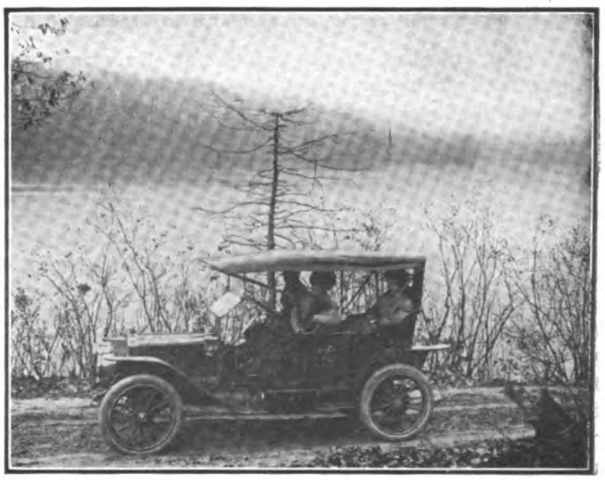
Three Views of Historic Litchfield: Left, Wolcott Mansion; Centre, Elm Street Drive; Right, Old Whipping Post.

tuck rivers, with a wide verdant park and well shaded trees. Nearby is a silver mine, which was worked prior to 1790, and the town is one of the centres of the tobacco trade in the valley. The way then leads along the Housatonic to Brookfield and beyond, and finally reaches Danbury, the home of the hat industry.



From this point to Bridgeport the road is most direct. Stop may be made to visit Putnam Park, established in memory of Israel Putnam. If desired the boat across the sound may be taken in the evening. The ferry is operated only twice daily, at 1:30 and 6:30 in the afternoon. Should the tourist elect to remain over night in the Park City, abundant opportunity may be had to explore the vicinity before taking the first boat to Port Jefferson the morning of the following day.

The harbor at the latter place is conceded to be one of the most beautiful on the sound. The town is built up on terraces, which extend back from the water's edge in pleasing array, the many hued trees lending their charm to the situation.

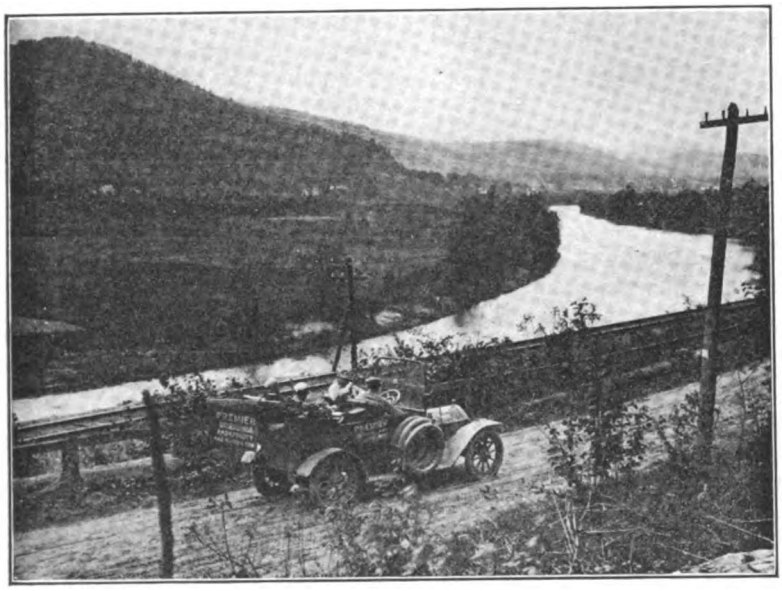


The second day soon finds the tourist at St. James, in which is located the summer estate of Mayor William J. Gaynor of New York City, Deepwells. A drive through pretty woodland leads to an arm of Lake Ronkonkoma, the terminus of the Long Island Motor Parkway. About this lake are numerous little coves and streams which form a perfect outline of a pair of spectacles. The lake itself has baffled government geologists in their efforts to learn why this body of fresh water should have a tide which rises and falls every seven years. It has no direct connection with the sound, the ocean or any other tidewater, and its actual depth is not known.

Then comes Bread and Cheese hollow and the headwaters of the Nissequogue river, the happy hunting grounds of the Long Island Indians. And finally the motorist finds himself on the opposite shore of the island at Bayport. The way turns eastward along this shore to Sag Harbor and Greenport. Boats leave Sag Harbor for New London at 6 in the morning, at 12:30 in the afternoon, and Greenport at 6:30 and 1:40. The tourist has the option of remaining on the island or crossing to the mainland, depending largely upon the time he arrives at these places.

The third day leaves New London behind to enjoy the beauties of the Connecticut shore. The route is over the main line to New

The Happy Hunting Grounds in Nissequogue Valley, on Long Island.



Skirting One of the Little Ponds in the Vicinity of Lake Ronkonkoma.

Digitized by Google

York for some distance, crossing the Connecticut river on the new bridge between Lyme and Saybrook. Of course, the return to Hartford may begin at Saybrook, following the better known Connecticut valley road, but it is anticipated that the trip will be undertaken for the purpose of exploration, and the itinerary as outlined from Guilford will be found fully as enjoyable.

Lyme is a venerable hamlet, half-buried in foliage, its Main street lined with old trees and historic mansions, among the latter being Black Hall, the homestead of the patrician Griswolds. Westbrook and Clinton, are two quiet towns on the shore, much frequented by summer people, because of the absence of the trolley and other disturbing seaside factors. Madison is almost equally known in this respect.

Connecticut Valley Supplies Beautiful Mountain and River Scenery.

Guilford was settled in 1639 by four immigrants from Kent and Surrey, England, its former Indian name being Menuncatuck. During the extermination of the Pequots by the Mohegans, a few years previous to this time, the sachem, Uncas had his headquarters at this point and numerous battles were fought in this vicinity. In 1781 the regicides were hidden in an old house, which still stands. Three frigates landed a force which marched through the streets during this period, but the rapidly gathering militia drove them off, before the fugitives were located.

North Guilford is somewhat isolated from the surrounding country and offers abundant opportunity to witness the quaint and beautiful. The sound may be seen at intervals, but the motorist's attention is much more likely to be taken up by the interesting bits of woodland scenery, which continue through Bluff Head, from which point pleasing outlooks upon the Connecticut river may be had. Middletown is the seat of Wesleyan University and the view from the tower of the old chapel is considered by many as unequalled throughout this district.

After leaving Middletown, the road follows this river through Cromwell, Rocky Hill and Wethersfield. This is a favorite drive for Hartford motorists and is almost too well known to need comment. Rocky Hill is so named because of its trap rock and sandstone ledges, and commands an interesting view of the river toward the north, clear weather making it possible to discern the outlines of Mts. Tom and Holyoke in Massachusetts, leagues away.

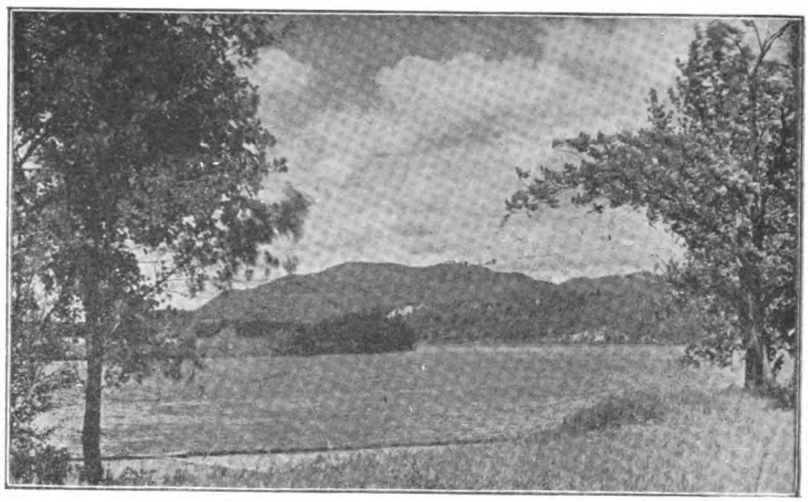
IN THE GREEN AND WHITE MOUNTAINS.

Outward Trip Is Along the Connecticut Valley, Thence to Lake Champlain and Northward to Canadian Line, and Return by Way of Lake Sunapee.



A TOUR that is outlined to occupy five days and to visit the Connecticut valley, Lake Champlain, the mountains of northern Vermont and the White mountain region, is that outlined in itinerary No. 21. The start is made from Springfield, Mass., crossing the Connecticut river into West Springfield, where it is possible to view the old Day house, built in 1754, and the home of Capt. Day, who was active in organizing the so-called Shays' rebellion. The way then leads along the west bank of the river, past a number of large truck farms, into Holyoke, where opportunity may be had to study the paper producing industry.

Just beyond Holyoke is Mt. Tom, one of the highest peaks in that section, and a little further along, Mt. Holyoke raises its head across the river. Northampton is the seat of Smith College for girls, and there are a number of interesting drives in and about this city. A little further along is Sugar Loaf mountain, the scene of some of the bloodiest tragedies of the King Philip and later Indian wars. King Philip is said to have directed the movements of the western Indians from his headquarters on this mountain, and Table rock, a beetling cliff on the east side, has a seat cut in the side, which is called King Philip's chair.

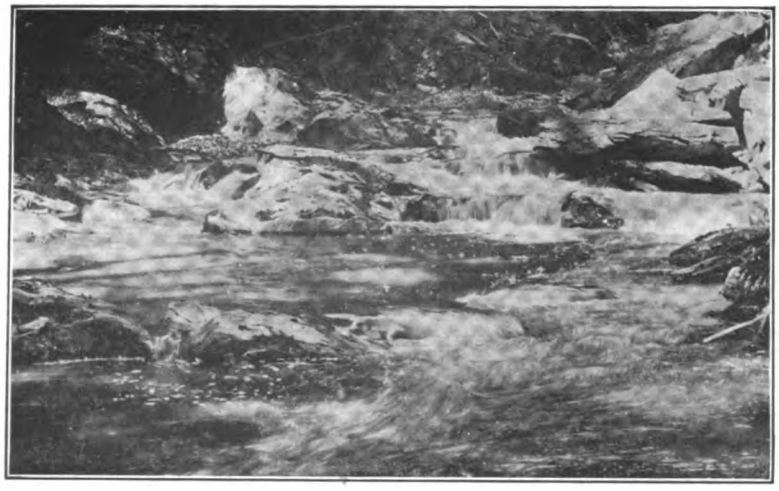
In the northern part of South Deerfield is a monument on the Bloody Brook battlefield. Sept. 18, 1675, Capt. Lathrop and 84 men were conveying a train of grain wagons from ruined Deerfield to Hadley, and as they passed this brook they halted to rest and pick some luscious wild grapes which hung in clusters over its waters. While they were thus engaged 700 Indians fell upon them, and but seven men escaped.

Deerfield was sacked and burned and then abandoned shortly before this battle. Later it was settled again by a number of younger men, and in 1694 it was again attacked, although ably defended by the settlers, headed by their pastor, Rev. John Williams. Feb. 29, 1704, a third attack was made, and this time the village was destroyed again, only one house remaining. One hundred and twelve captives were taken to Canada, where they were held for ransom. Memorial Hall contains an excellent collection of historical relics.

Soon after passing Greenfield, the route crosses the river again into East Northfield, the seat of the Moody School for girls, and of other institutions organized and perpetuated by Dwight L. Moody. Mt. Herman School for boys is situated only a short distance away.

Mt. Holyoke, Across the Connecticut from Smith's Ferry.

Entering Vermont at Vernon is noted the magnificent dam across the river, which furnishes Brattleboro with a splendid lake front. The electricity generated at this dam furnishes light and power for numerous towns in northern Massachusetts, as far distant as Worcester. Brattleboro is naturally very beautifully situated and is the business centre for a large area in both Vermont and New Hampshire. The Estey organ works here are of especial interest.



In Putney are long strata of roofing slate, and the rare mineral, fluor spar, of a rich emerald green. In 1775, a strong timber fort was erected, which protected the settlement until the conquest of Canada made it unnecessary.

Bellows Falls was a favorite Indian resort, because of the large number of salmon and shad near its rapids. A short distance above the old bridge at this point are a number of hieroglyphics, which Schoolcraft decided were the records of an ancient battle. The river falls 42 feet within half a mile of the village, forming a white and impetuous rapids.

Charlestown, N. H., was settled by Massachusetts people and was originally named Number Four. Between 1746 and 1760, it was repeatedly attacked and conducted a defense so admirable that the enemy decided at last to abandon the conquest. During the later French and Indian wars it was a military station. It is situated between two broad, rich meadows, and has a long, wide, well shaded street.

Ascutney mountain comes into view just above Claremont, and the river is recrossed into Vermont at Ascutneyville. At Windsor, during a heavy thunderstorm and with the news of the fall of Fort Ticonderoga ringing in their ears, the deputies of the Vermont towns adopted the state constitution, July 2, 1777. Ascutney, the name

One of the Many Gorges Worn by the Winooski River in Vermont.

of the mountain, which is easily reached from Windsor, was Indian for Three Brothers, and is supposed to refer to the three singular valleys which run- down its western slope. Early settlers claimed they often saw a curious light overhanging the peak at night. White River Junction is the night stop, at the union of the White and Connecticut rivers.

The second day, the route follows the picturesque White river for a time, branching off to climb the Green mountains toward Montpelier. Joseph Smith, founder of Mormonism, was born in Sharon. At Royalton, occurred the last attack by the Indians on New England in October, 1780. Two hundred redskins plundered and burned the village, as well as Sharon, and captured 27 of the people.

Bethel is a busy manufacturing village among high hills. A little further along is the famous Williamstown gulf, through which it is seldom indeed that cool breezes do not blow. The view from this point to Barre and Montpelier is most superb. The route from the capital of the state to Burlington is a reversal of a portion of tour No. 1.

Near Winooski is the romantic canyon on the river, and at High Bridge, the impetuous stream has cut a gorge through the solid rock 90 feet deep and 70 feet wide. St. Albans is the night stop, located on an elevated plain, three miles from Lake Champlain. A neat park of four acres in the centre of the city, is surrounded by hotels and numerous public buildings. A Norman-towered Episcopal church of red sandstone is most noteworthy. A magnificent view may be had from Aldis hill, about a mile to the northeast.

The third day takes the tourist first to Sheldon, near which are located the famous mineral springs. That near the Missisquoi falls has had an enviable reputation. From Dunton's hill, a vast panoramic view of the Green mountains is obtained, while the silver waters of Lake Champlain, the Adirondacks and the spires of Montreal are to be included in the scene. At Richford, Jay peak rises to an altitude of over 4000 feet.

Newport is located at the upper end of Lake Memphremagog, and from the edge of the town rises Prospect hill, from which excellent lake views may be obtained. The lake is 30 miles long, and two-thirds of it lies in Canada. Barton Landing was the scene of much smuggling during 1810-15. At Barton, may be seen Crystal lake and the Flume, where a brook flows through a natural passage in the granite rock, 170 feet long, 10 wide and between 20 and 30 deep. The granite walls are smooth and perpendicular. In 1810, the people of Barton determined to widen Barton river by turning Long pond into it. They barely had completed a channel, when the waters burst through with tremendous force and swept down to Lake Memphremagog, wrecking everything in their path and causing immense damage. The bed of Long pond is now dry and is called Runaway pond.

Numerous rare plants are to be found along the sides of Lake Willoughby, a magnificent sheet of water on the way to Lyndon and St. Johnsbury. Tour No. 1 is followed again for a short distance to the night stop at Bethlehem. The fourth day, return is made to Littleton, with its far-viewing heights, and then the tourist turns toward the Connecti-

When a Summer Breeze Stirs Up the Waters in St. Albans Bay, Vt.

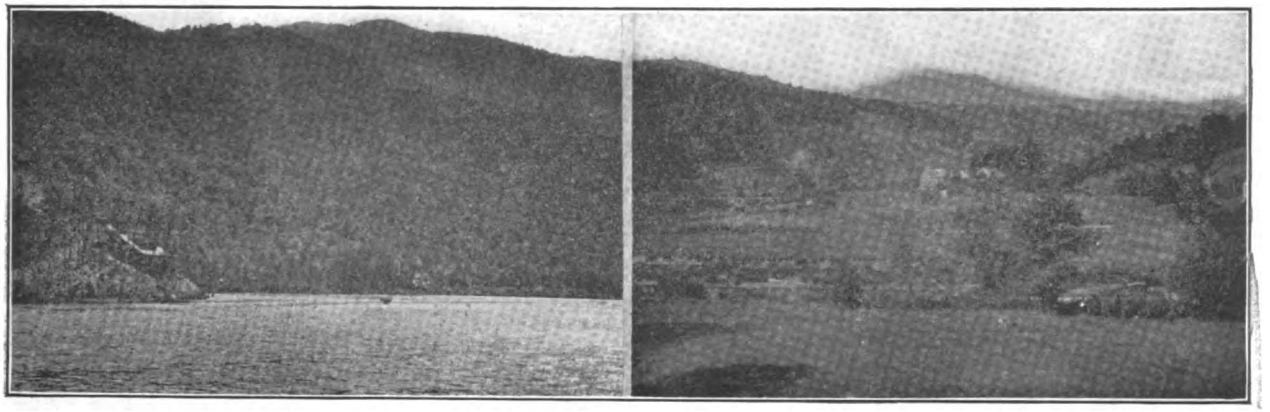
Digitized by Google

cut river, visiting Lisbon, somewhat noted for its gold mining, Bath with its picturesque glen, and Woodsville, on the way to Wells River, Vt.

Near Bradford is Devil's Den on the side of Wright's mountain, where one Wright, who claimed to be a prophet, lived the life of a hermit in a dismal rocky cleft. Fairlee is a hilly town abounding in pretty lakes, one of which is nearly three miles long. Mt. Cuba and Mt. Sunday cast their reflection upon these waters. Cuba falls and the perpendicular cliffs of gray granite on Sawyer's mountain are worthy of special notice.

North Thetford produces much copper ore, which is sent overland to Portsmouth, N. H., thence to Baltimore by ship. Below Thetford distant views of Moosilauke and Bald mountains are to be had.

the way to Hinsdale a splendid outlook over the new dam of the Connecticut River Company is afforded. After crossing the state line into Massachusetts the Moody schools at Northfield and East Northfield, may be visited. Then comes the Massachusetts Agricultural College at North Amherst and Amherst College at Amherst. Just above Moody's Corner the road enters a narrow gorge between two mountains of the Holyoke range, and from this point the views of Mt. Holyoke and Mt. Tom are such as to hold particular interest.



Time should be taken at South Hadley to visit the campus of Mt. Holyoke College for girls, concerning the fantastic beauty and sublime majesty of which much has been written. The surroundings at the college are especially pleasing, and the grove frequently

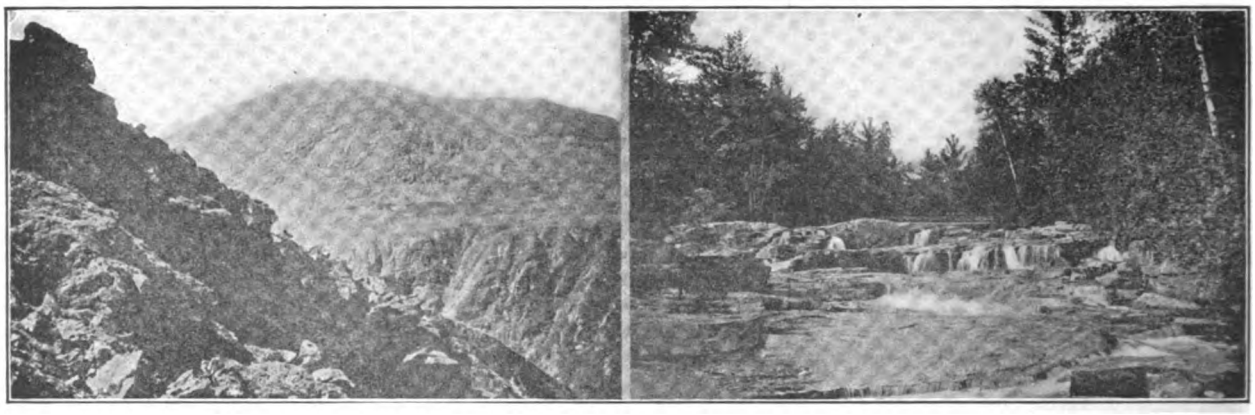
Two Famous Green Mountain Scenes: On Left, Lake Mansfield at Foot of Peak by the Same Name; at Right, View of Camel's Hump as It Appears from Waterbury, Vt.

Hanover is the seat of Dartmouth College, founded in 1770 as a school for Indians. At first it had 24 students, domiciled in huts built of green logs, situated in the midst of a vast wilderness. At West Lebanon is the Tilden Ladies' Seminary, whose fine buildings are seen on a commanding hill.

In the vicinity of Mascomy lake, near Enfield, is a community of Shakers, which has furnished much fine wood and wooden ware for the market. Lebanon is a pretty manufacturing village on an elevated plain near Mascomy falls. Croydon is noted for its splendid granite quarries.

The night stop is at Sunapee, and the morning of the fifth day finds the tourist reversing a portion of tour No. 11 to Keene. On

is utilized as an outdoor theatre for the presentation of Shakespearian plays and similar productions.



Chicopee, at the confluence of the Chicopee and Connecticut rivers, is the home of the Ames foundry, in which the superb bronze doors of the United States Senate chamber were cast during the Civil War. The doors of the House of Representatives were made in Munich, and the Senate doors were to have been cast in the same place. The over-prudent Bavarians demanded their money in advance, and the government decided to try home production. The work of the Chicopee foundry, while little was hoped or expected from it, challenges comparison with the best from the Munich concerns.

THREE DAYS IN THE DOMINION OF CANADA.

Outlining a New Route Between the States and the City of Quebec, with a Splendid Trip up the Valley of the St. Lawrence to Montreal.

THE three-day trip outlined in tour No. 22 is a substitute for the better known route between Quebec and the States by way of Jackman, Me., and is suggested as a continuation to itinerary No. 2 at Montreal. The starting point is at Newport, Vt., and the night stops, Quebec and Montreal.

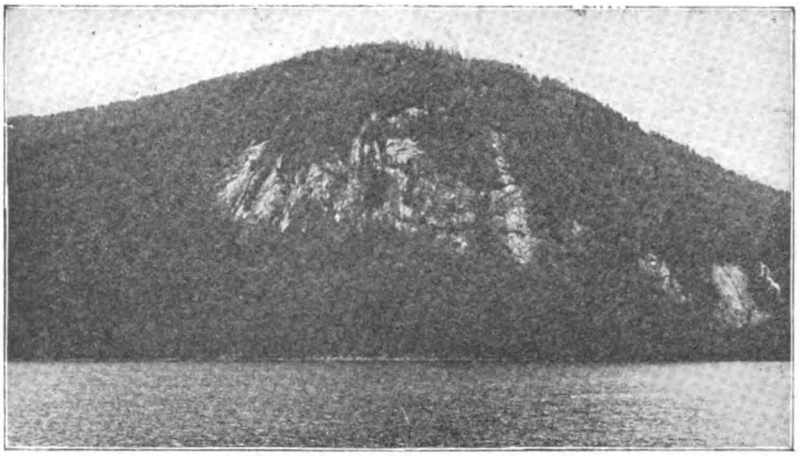
The customs formalities must be arranged at Stanstead, a short distance from Lake Memphremagog. Several picturesque lakes are viewed on the way, including Massawippi, near the town of that name; Noir, near Marbleton; Weeden, near Weeden; Aylmer, at Garthby; Francis, at D'Israeli; Clapham and Marie, between Thetford Mines and Robertson. Marbleton is noted for its marble quarries and lime pits, while at Thetford Mines are located the largest asbestos deposits in the world. Bell mine has an area of several acres and is 150 feet deep.

The final portion of the drive into Quebec is exceedingly picturesque. Beyond Leeds, Parkhurst and St. Giles, the road winds along the bank of the Beaurivage river to the St. Lawrence. It is understood that the magnificent Quebec bridge, which is said to be the largest single span bridge in the world, was opened last year, and that the tourist will not be obliged to enter the city by ferry as has been necessary heretofore.

Quebec is filled with historic interest. In many respects it is the most quaint and picturesque city on the American continent. Of the many side trips, the following may be mentioned: Ste. Anne de Beaupre, where thousands of pilgrims annually visit the relics for miraculous cures; the falls of Ste. Anne and those of Ste. Fereol, still further to the east; Lake Beauport, Indian Lorette, and Cap Rouge.

The view of Quebec from the St. Lawrence in the early morning is said to be a sight never to be forgotten. Above the city the river flows between the Laurentian mountains. Then the tour passes Lake St. Peter, where the St. Lawrence broadens out on the lowlands. Among the features of this body of water are the lumber rafts on which are carried the rude huts of the lumbermen. At various points along the route, quaint old towns are passed, in which the people, like those during the previous day's drive, speak French for the most part, and many old-world characteristics are noted.

Montreal is the metropolis of the Dominion of Canada and is termed "the Queen of the St. Lawrence." It is one of the most beautiful cities on the continent of North America, and has a history dating from 1535, in which year Jacques Cartier visited the triple-walled Indian village of Hochelaga and ascended the lofty hill beside it, which from the beauty of its view he named Mount Royal.



Chambly, reached early the third day, was fortified by the French in 1711, and in 1775 it had a strong stone fort, erected by the British. The town is situated on a lake-like expansion of the Richelieu river, known as the Chambly basin, and the Chambly rapids are nearby. Knowlton is at the foot of Brome lake, with Brome mountain about 10 miles distant, although in full view. At South Bolton, the tour goes through the Bolton notch, with excellent views along the way. Customs arrangements may be perfected at Mansonville. The return to Newport from this point is along the shore of Lake Memphremagog with excellent views of Owl's Head.

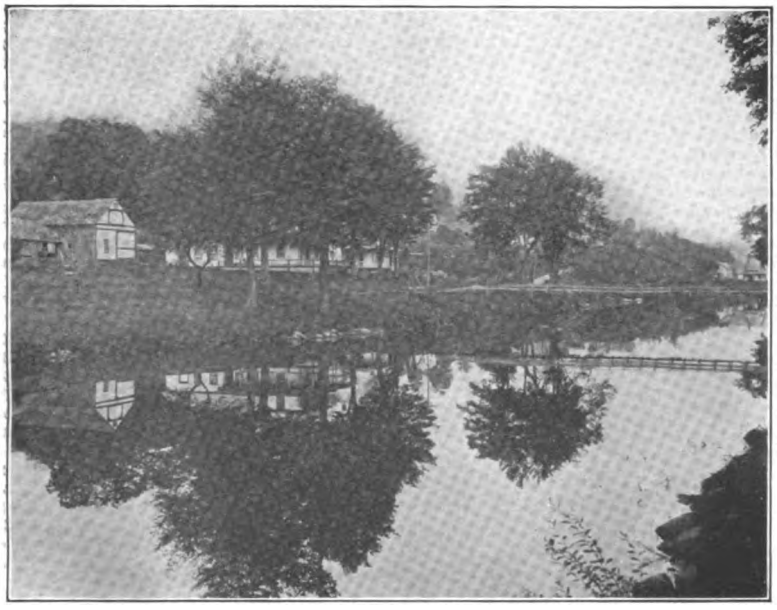
DOWN THE VALLEY OF THE HUDSON.

Along the Connecticut Shore, Overland into the Connecticut Valley, Through the Green Mountains and Back to New York by Way of Saratoga Springs.



FOR those who love the beautiful in nature the Green mountains hold a particular charm. The roads leading through this region are not quite as ideal as those over which motorists have been wont to visit the White mountains of New Hampshire, but they offer little difficulty for the modern car. In some respects this adds to the delight of the tour, since it gives opportunity to get into more intimate touch with the mountainous districts.

As outlined this itinerary contemplates starting from New York City, the way leading along the shore of Long Island sound, through many of the residential suburbs of the metropolis, both in New York and Connecticut. Stamford, Norwalk and Bridgeport offer plenty of inducements to tarry by the way, and the intermediate shore resorts are equally inviting.

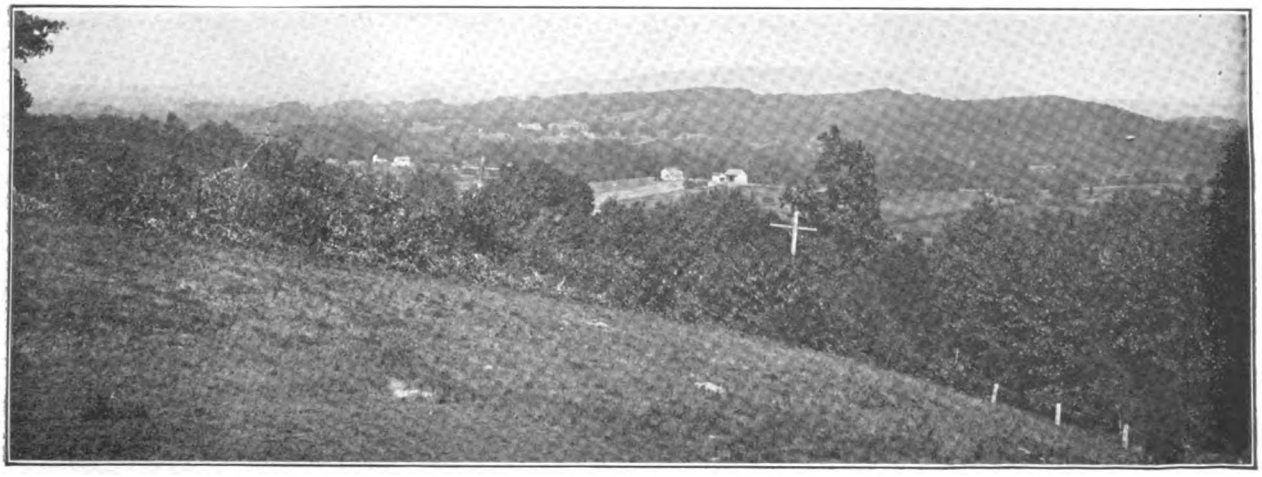
After passing Stratford the valley of the Housatonic is followed to the confluence of the Naugatuck at Shelton. This latter city is so interwoven with those of Derby and Ansonia as to make them practically one large centre. Seymour is a prosperous manufacturing town, although it suffered last year by reason of a flood, resulting from the breakage in the dam which held back the Naugatuck at this point. The borough of Naugatuck is a thriving rubber centre. Waterbury, the Brass City, is the night stop, and it will be found that the day's mileage has not been such as to preclude the possibility of taking advantage of some of the numerous pretty drives in this city and vicinity.

The second day takes the tourist over the new road to Southington mountain, through Southington, Plainville and Farmington to Hartford, the capital of the state and noted for its beautiful parks. The Massachusetts line is crossed at Southwick, that little "neck of land" which extends down into the state of Connecticut. The road from this point to Northampton, the seat of Smith College for girls, lies along the base of several mountains of the minor class, chief among which is Mt. Tom. Still others of the same character are passed on the way through South Deerfield and Deerfield to Greenfield, and the Vermont line is crossed soon after leaving the latter town. The night stop is at Brattleboro.

Digitized by Google

The Mirror in the River at South Londonderry, Vt.

The mountains of the second day virtually are the foot hills of the Green mountains, and the more imposing peaks come into view early on the third day. Good roads lead into Newfane, near which is Putney mountain and Sunset lake. Splendid fishing and hunting are offered in season. Jamaica is another comfortable country town surrounded by beautiful green hills, almost in the West river valley.



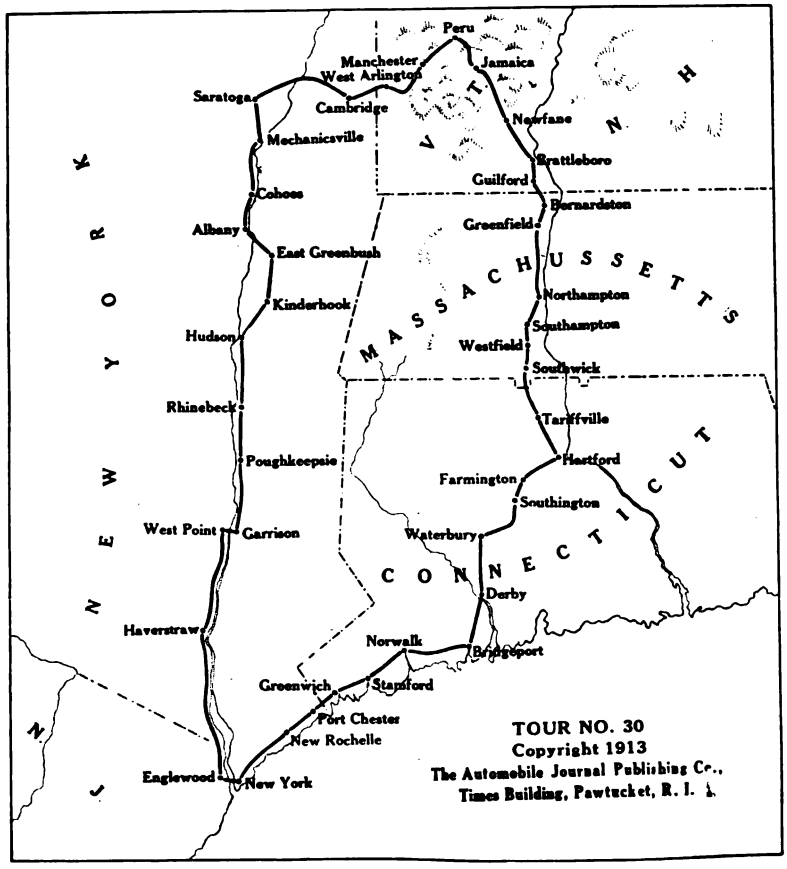
Innumerable lakes and streams dot the landscape in the vicinity of South Londonderry, and there are several attractive scenes within easy reach. Among these may be mentioned Hamilton falls, Flat rock on top of Glebe mountain, and Devil's Den. Manchester Center is admirably located between three mountains and is one of the highest points in this section. Manchester is at the base of Mt. Equinox, and at Stratton mountain, toward the southeast, is the romantic pass known as Stratton gap.

The state seal of Vermont had its origin in Arlington, in which town are the West and Red mountains. The way leads down the valley of the Battenkill to Cambridge, N. Y. This river is crossed at Greenwich, and then the country becomes more flat and uninteresting on the way to Saratoga, the night stop.

Saratoga Springs, once one of the foremost summer resorts in America, still retains its many health giving springs which won for it at least a portion of its wide reputation. The village is situated on a plateau a few miles west of the Hudson river, and may be made the headquarters for a number of pleasant drives about the lakes in the southern end of the Adirondack region. Lake Luzerne, 22 miles north of Saratoga, is a particularly picturesque sheet of water, and one that is easily reached, despite the grades. Saratoga lake is about four miles from the village and is reached by a favorite drive termed the Boulevard.

Good roads are offered for the trip between Saratoga and Albany by way of Mechanicsville and Waterford. Below Albany is Kinderhook, where may be seen a number of ancient buildings, among them being the Van Alen mansion built in 1721 and the Van Schaack mansion erected in 1774. Two miles below the village is Lindewald, the home of Martin Van Buren, and before that the home of Peter Van Ness. Time should be taken to visit the house, if possible, particularly the entrance hall with its picturesque wall paper of Van Buren's time. Near Upper Red Hook is North bay, in which Fulton constructed the Clermont. Poughkeepsie, the seat of Vassar College for girls, is the night stop, although it would be possible to continue the drive into New York City on this side of the river during the day's run if found desirable.

As planned, the tourist is expected to cross the Hudson at the



View of Southington Mountain, Near Waterbury, Conn., with Hanging Hills of Meriden in the Distance.

Digitized by Google

Garrison-West Point ferry, visiting the United States military academy and running down the west bank of the river, where some of the grandest scenery in America is to be seen. Magnificent views of the Palisades are to be had as the city is approached, and the roads are of macadam practically the whole distance. Return might be made from Nanuet over itinerary No. 51 by way of Tarrytown, thus avoiding entering the State of New Jersey.

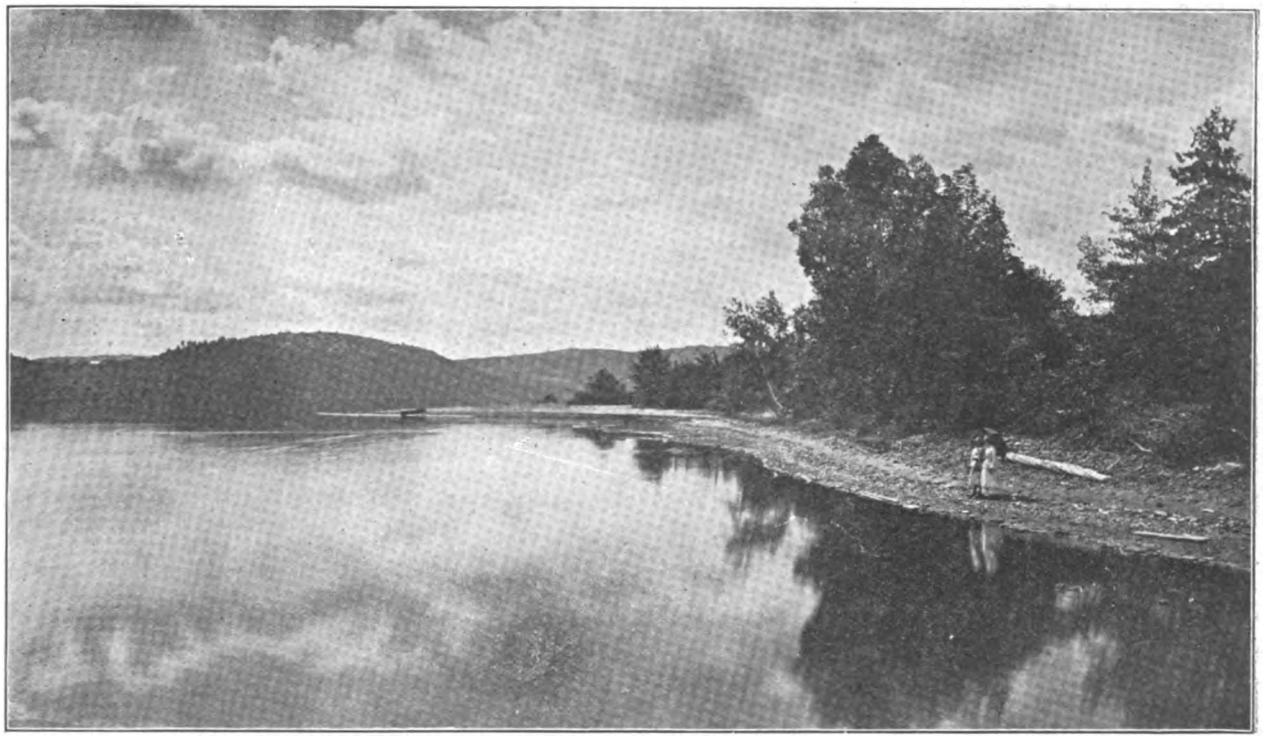
THE ADIRONDACKS AND CANADIAN POINTS.

Visiting Mountains and Lakes of Northern New York, Crossing the Border to Montreal, Ottawa and Toronto, and Returning by Way of Niagara Falls.

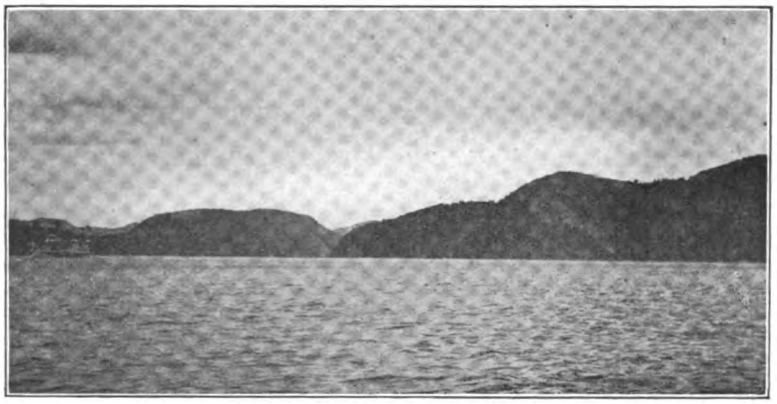


COMBINING some of the most interesting touring ground in the Dominion of Canada with the Adirondack region and a portion of the transcontinental route through central New York State, this itinerary contemplates that the motorist will start from Albany. The route the first day is along the Hudson for a time, until the Falls of the Mohawk are reached north of Cohoes, and then away from the river to Saratoga.

For years Lake George has been a favored resort of those who love the beautiful in nature. The lake itself is 35 miles long and in some places four miles wide. The hills and vales of the neighborhood, as well as the waters themselves, witnessed many fierce engagements during the French and Indian, and Revolutionary wars. A few miles distant is Loon lake, one of several by that name in this region, although not so well known as that other in the extreme northern part of the state.

Schroon lake is indeed a pretty sheet of water, 10 miles long and at an elevation of 807 feet. The valley of the Schroon river is next followed until the low divide is crossed, and the route then lies along the Pleasant valley to Elizabethtown. The way becomes rough and more mountainous at this point, albeit the views are among the best to be found in the entire Adirondack region.

Considerable road work has been accomplished in the Keene valley and the motorist should have little difficulty in making Cascade Lake for the night stop. There are two of the lakes, and the scenery about them is held to be unsurpassed. Those who desire may spend some little time in this section, the roads now being in condition to permit of reaching many of the camps by automobile.



The tourist is now in the Adirondack foothills, and may visit the famous Ausable Chasm, with its grand succession of cascades and gorges early the third day. Keeseville, on the lake near the Chasm, is the turning point toward Canada, which is entered by way of Plattsburg and Chazy, at Rouse's Point. Here the customs regulations will have to be observed, licenses, customs bond and numbers being secured at a reasonable fee, as well as the necessary papers for readmission of the

Beautiful Schroon Lake in the Foothills of the Adirondacks and Surrounded by New York's Historic Ground.

While Saratoga Springs is not the resort it once was, the mineral springs have lost none of their interest. There are still many handsome buildings and the city is by no means deserted. A short distance further along is Glens Falls, intimately associated with recollections of Uncas, the last of the Mohicans, so graphically portrayed in Cooper's romance. It was also the scene of a decisive battle between the French and English in 1755.

Digitized by Google

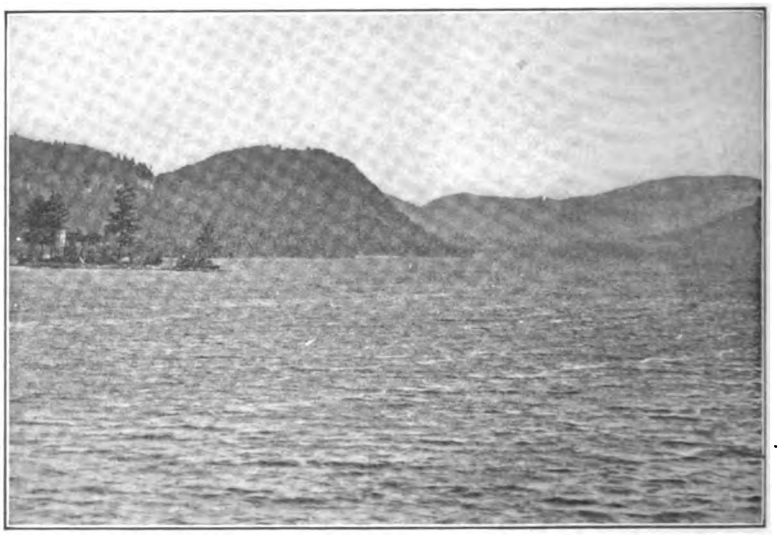
Brant Lake Vies with the Mountains in Tempting the Tourist.

tourist to the United States.

At St. Johns, Que., a chain of forts existed for years, extending along the Richelieu river from Sorel to Lake Champlain. It was the scene of a 45 days' siege by the Americans in 1775, at the end of which it fell and was destroyed. The St. Johns of today boasts of some excellent hotels and fine shops, as stores are termed on that side of the line, and also possesses a large barracks and military school. Across the river is Iberville, in which there is a curiously constructed church tower, reminding the tourist of the Turkish mosques, from the turrets of which the Moslems call the people to prayer.

Montreal is replete with the historic and the interesting, both as the result of nature and man's handiwork. It has been successively under French and English rule, and was for a time in the hands of the Americans. In 1776, the commissioners of the Continental Congress, Benjamin Franklin, Samuel Chase and Charles Carroll, held council in the Chateau de Ramezay. The city was the scene of many battles between the Indians and white men, French, English and Americans and is filled with historic tablets and monuments.

The third day takes the tourist from Montreal to Ottawa. The road is of clay and in wet weather is practically impassable. Should the tourist happen to reach this point under such circumstances, he is earnestly advised to ship his car by way of boat to Kingston, and rejoin the route at that point. A somewhat better road lies along the shores of the St. Lawrence river joining this route at Prescott, but if conditions are favorable it will pay the tourist to make the trip to Ottawa, as originally planned.



The way leads across Montreal Island, thence across the Isle of Jesus and along the shores of the Lake of Two Mountains to St. Andrews East on the River du Nord. It then lies to Carillon and across the Ottawa river to Point Fortune, following the south shore of this river to Little Rideau and L'Original. At this point it turns away from the river to Alfred and Plantagenet, and back again to the Ottawa at Wendover, skirting the river again to Clarence, Rockland, Cumberland and Orleans.

Ottawa is of interest because of its being the seat of the Canadian government, the buildings of which are situated on a picturesque bluff 150 feet high, overlooking the Ottawa river. They comprise three blocks of departmental buildings, the House of Parliament occupying the fourth side of the square. The famous Chaudiere Falls, where the river dashes over a ledge of rock 1260 feet high, are located in the west end of the city and furnish power for extensive lumber operations as well as lighting and street railway plants.

The fourth day finds the tourist on good roads once more, turning back toward the States. The St. Lawrence is reached at Morrisburg and is followed to Prescott, opposite Ogdensburg, N. Y., where the boat may be taken to Niagara-on-the-Lake. Just below Prescott is the famous Patriot's Windmill, the scene of a bloody conflict in the uprising of 1837. The old mill is now a lighthouse. In making the water trip from the Thousand Islands to Montreal, passengers change at Prescott for smaller boats, more suitable for shooting rapids, some of which are passed on this tour.

The route follows the north shore of the river to Brockville, from which point there is a ferry to Morristown, N. Y. The road now turns away from the St. Lawrence for a time, though within sight of the beautiful Thousand Islands, which are seen still better at Gananoque. The Rideau river is crossed at Kingston, the night stop.

Kingston is a quaint, attractive city and will reward amply a few hours' sight-seeing. The fine busi-

Anthony's Nose and Rogers' Rock on the Banks of Lake George, N. Y.

Digitized by Google

ness blocks and public buildings offer a pleasing contrast to the old forts and other evidences of early occupation. Among the interesting places to visit are Fort Henry, the Royal Military College (Canada's West Point), Queen's University and St. George's Cathedral.

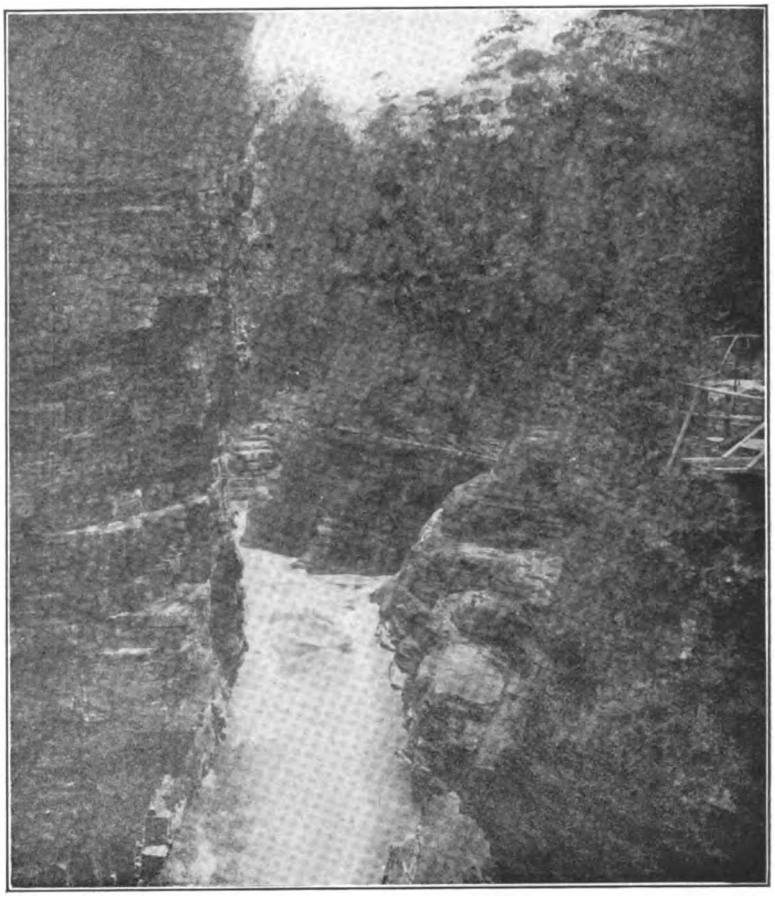
The fifth day's route skirts the north shore of Lake Ontario all the way into Toronto. Many splendid views of this immense inland lake are afforded, as the road follows the shore line for many miles. None of the towns en route are large, but offer sufficient opportunity to study the people and furnish a safe source of fuel supply at all times.

Toronto is a beautiful modern city, rich in architectural attractions and containing many eminent institutions of learning. Its extensive parks, broad avenues and pleasant environs make it exceedingly interesting to tourists. Located on the lake for some distance on either side of the city are numerous summer resorts, and Toronto is the centre from which these may be reached. If visited in the first week of September, the annual fair is worthy of a couple of days' stop.

The sixth day ends at Niagara Falls, one of the greatest wonders of the American continent. The tip of Lake Ontario is rounded at Hamilton, and from that point the roaring of the mighty cataract begins to penetrate above the humming of the motor. The approach to the falls from the Canadian side is perhaps a little less beautiful than from the American, still, there is so much that is grand and awe inspiring concerning the spectacle that comparisons seem out of place.

The customs regulations will have to be arranged at the Falls. Naturally, the tourist will desire some little time for exploration, and fortunately, the roads throughout the day's trip are such that the whole afternoon ought easily to be available. The trip to Queenstown Heights and Brock's monument is advised, especially. The short 20-mile drive to Buffalo can be made comfortably in the cool of the evening.

Buffalo may be considered the gateway to the immense touring country from the West. Similarly, it might be added, that the tourist could so plan an extension of his vacation to include portions of the Middle West before returning.



The return trip from Buffalo is almost too well known by motorists to need extended comment. There should be little trouble except in the so-called Montezuma swamp between Montezuma and Port Byron, and then only in wet weather. Among the points of interest on the way may be mentioned the home of Joseph Smith, the founder of Mormonism, at Palmyra, where he claimed to have discovered the golden plates of the Book of Mormon. Nearby is the village of Hydesville, the home of the Fox sisters, who were instrumental in establishing Spiritualism. Three miles north of Oneida is located the famous Oneida Community, founded in 1847. South of this town is the Oneida Indian reservation, from which excellent views of Oneida lake may be obtained. The last portion of the tour is along the Mohawk valley.

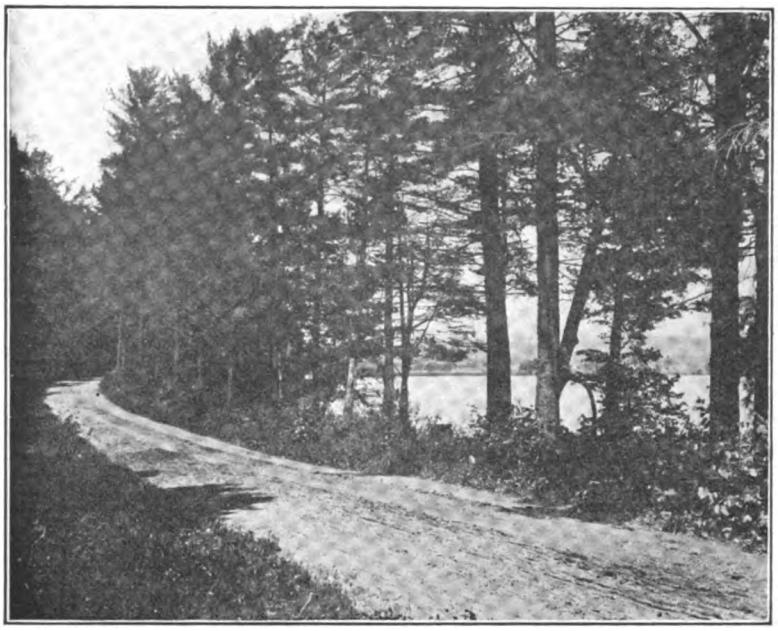
Niagara Falls, as Seen from the Canadian Side.

THE LAKES OF CENTRAL NEW YORK.

After a Day in the Vicinity of James Fenimore Cooper's Home, the Tourist Reaches One of America's Most Interesting Groups of Inland Lakes.

FOR those who delight in the romantic, somewhat off the beaten paths, no section of the East contains more charm than the lake district of central New York. Fortunately the towns in the vicinity early recognized the advantages of cultivating automobile touring, inasmuch as they are not a little neglected by the railroads. Their delightful scenery is such as to merit wide attention on the part of the tourist and the motor car has done much to bring these beauties within easy reach.



Leaving Binghamton the morning of the first day, the tour follows the valley of the Susquehanna river for some distance, skirting the foothills of the Catskill mountains, particularly as the route nears Oneonta. Numerous small lakes and pretty little trout brooks divide attention with the hills and mountains in the distance, but it is not until Cooperstown is reached that it may be said the lake region is entered.

Cooperstown, the home of James Fenimore Cooper, is on the shore of Otsego lake, and this entire region has been so touched by his genius as to be familiar ground to those who revel in his works. In a park at the centre of the town is a boulder surmounted by the figure of an Indian, which marks the spot where Cooper lived. Fairly good roads encircle the lake, and time might be spent profitably in catching numerous glimpses of its remarkable beauty on this side trip.

The night stop is at Richfield Springs on Canandarago lake, better known by the name of Schuyler. No more inspiring views are to be found anywhere on the American continent than in this vicinity. It is extremely doubtful if the tourist will be satisfied with a night stop at this point, but other lakes still further along offer other charms, and it will be hard for the motorist to decide just how much time he may allow himself away from home.

The second day's run enters the Mohawk valley, which is followed into Syracuse, not forgetting to

Digitized by Google

Pine Grove Drive, a Pleasing Scene Near Richfield Springs, N. Y.

mention Cazenovia, a summer resort of considerable repute situated at the foot of a pretty little lake, which empties into Lake Oneida. Time should permit of taking the pleasing little drive about the shores of this sheet of water. After leaving Syracuse, the main route through central New York is followed for a time, practically into Geneva.

Auburn is on Cayuga lake, which may be skirted if it is desired to extend the tour beyond the three days originally planned. This additional mileage will amply repay, as there are many attractions within easy driving distance. Among these may be mentioned Taghanic falls, at the end of a gorge a mile long and 400 feet deep, where the water takes a sheer drop of 250 feet, higher than Niagara.

Geneva is on Seneca lake, which is reached along the banks of the Seneca river from Seneca Falls, after the Montezuma marshes are passed. This lake is considered the most picturesque of the entire group. It is 38 miles long and from two to six miles wide. Steamers may be taken from Geneva to Watkins, if more time is desired for exploring portions of this district. This route anticipates making Penn Yan, on the shores of Keuka lake, the night stop.

Penn Yan is some 900 feet above the level of Seneca lake, and the road from Geneva is a gradual rise, although it can be made practically all of the way on high speed. Possibly it will be well to continue the journey about two miles south of the city itself for the night stop, as here opportunity is afforded to spend the night on the banks of the lake in a new hostelry, which is famed throughout this district for treatment accorded to motorists.

The third day finds the tourist between the two arms of the lake on his way to Bluff Point, 700 feet above the surface of Keuka, which is 900 feet above the level of Seneca. From this elevation an extensive view of the surrounding country is obtained, a clear day affording glimpses of four counties. Looking down upon the lake itself, the visitor is surprised to see what appears to be a toy steamboat, and finds it hard to believe it is one of the large lake steamers with a capacity of 400 to 500 people. Immediately below a reflection of glistening oars and little specks on the water, not unlike a school of minnows, prove to be full sized rowboats filled with fishing parties.

Keuka lake is in the centre of the rich grape country, and the district is famed for its wines and champagnes. None the least of the pleasing pictures from Bluff Point are the vine clad, ravine broken hills, many of which will be visited on the trip from Bluff Point to Hammondsport, but first the tourist must turn north to get around the lower end of the other arm of the lake at Branchport.

From Branchport to Hammondsport is a steady drop, with the lake level lost to view. On either side are to be seen the vineyards, and at Hammondsport, 300 feet above the surface of the lake, the tourist finds a view to the northward, which for breadth, distance and picturesque

One of the Many Interesting Trout Streams in the Foothills of the Catskills.

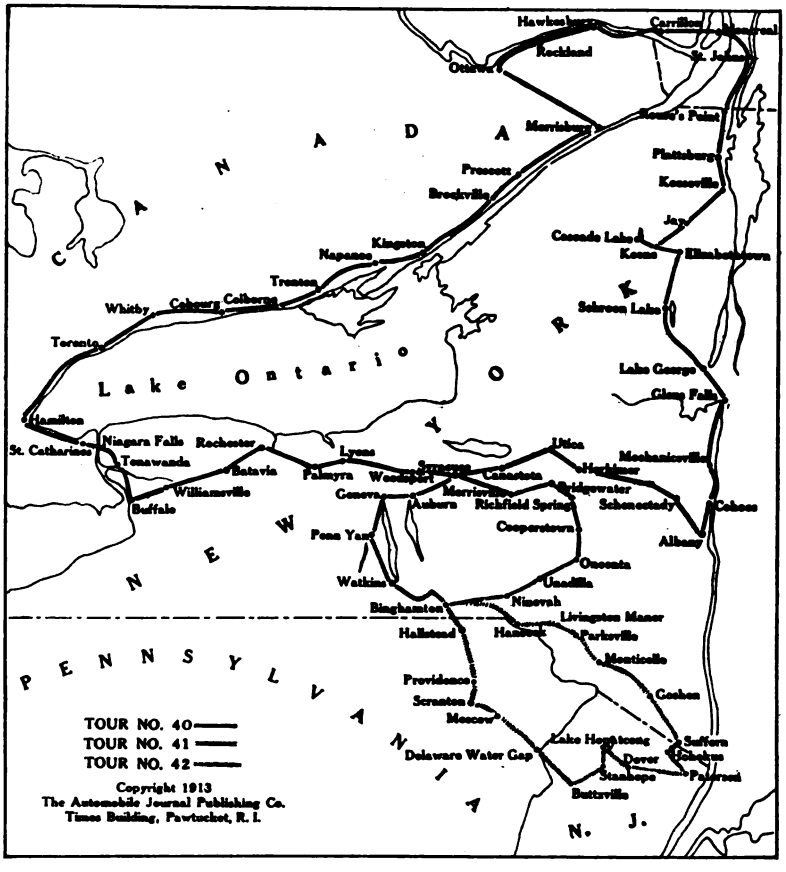
Digitized by Google

beauty is to be equalled nowhere.

Hammondsport is the home of Glenn H. Curtiss, and his plant for the manufacture of aeroplanes. A visit to this industry will offer a pleasing diversion, as many of the Curtiss aviators are continually testing out new machines in the vicinity of the city. Recent activities have been in connection with the perfection of the hydaeroplane, and the waters of the lake are utilized by the United States naval students of aviation as well as the Curtiss instructors in exploiting the latest inventions.

Turning eastward again, the way leads past Lake Wauneta, between Weston and Wayne, and then on to Watkins, at the southern end of Seneca lake. Here, time should be spent in visiting the famous Watkins Glen, one of the most remarkable of nature's wonders, now a state park.

During the ages the small stream, in making its way from the hills to Seneca lake, has worn a deep gorge in the soft rock at this point, until now the water tumbles over a series of gorges, some of them nearly 200 feet deep. Sometimes the cut is no more than 10 feet wide, while at others it broadens out into vast amphitheatres, in which the echo of the tourist's voice sounds wierd and almost supernatural. This chasm penetrates the hills for three miles, winding and curving abruptly, and presenting an almost infinite variety of rocky and picturesque scenes.



The return to Binghamton is over the divide into the Susquehanna valley. The country is still picturesque, although by no means as romantic in its beauty as that which has occupied the tourist for the greater portion of three days. The road is excellent, while not of macadam, and good time can be made.

POCONO MOUNTAINS AND SUFFERN HILLS.

Itinerary Covers Northeastern Pennsylvania, Delaware Water Gap, Northern New Jersey and the Wallkill Valley in New York State.

TOUR No. 42 has Binghamton, N. Y., as its starting point, with Delaware Water Gap, Penn., and Suffern, N. Y., as night stops. It covers northeastern Pennsylvania, northern Jersey and the Wallkill valley of New York, and makes a number of connections with other tours outlined herein.

Crossing the Pennsylvania line, the first town of importance is Hallstead, rich in Indian traditions. The tiny gravel point in the middle of the Susquehanna at this place was once an island, around which the savages used to race in canoes, the prize for the swiftest being the honor of chief of the funmakers for the day. High upon the cliffs above the river, at a point seemingly inaccessible, was once a picture of a red chief in full war paint. The picture gradually faded, but the red remained, giving to the cliff its present name of Red Rock.

Scranton is situated in a pocket among the mountains and on the banks of the beautiful Lackawanna. The outskirts of the city are marked by a number of culm banks and coal breakers, bearing eloquent testimony of the unceasing search for coal.

Eastman's Glen in the Vicinity of Livingston Manor, N. Y.

The tour then begins the climb to Mt. Pocono, and descends to Stroudsburg, the views presenting panoramas of waving pine, mountain laurel and rhododendron, which grow in endless profusion along the walks and driveways in this section. The night stop is at Delaware Water Gap.

The second day's run enters New Jersey, climbing into the Schooleys mountain region, and visiting the interesting district about Lake Hopatcong. The roads will be found to be good for the most part, with occasional stretches of macadam. The views of mountains on either side, combined with those of the fertile valley, make this an ideal trip. The night stop is Suffern, N. Y., from which point connection is made with tour No. 51 for the New England states.

Goshen is in the midst of a famed stock producing country. Middletown is the centre from which the famous Orange county milk and butter is shipped to New York City and other points. Highview is located on the eastern slope of the Shawangunk mountains, and as its name implies, affords a broad and extensive view of the valleys and the Catskills. Mamakating is on the other slope of the same mountain, and near this is Mamakating park on the banks of the lake by the same name, a beautiful body of spring water covering 100 acres.

Connection is again made with tour No. 51 at Wurtsboro, on its return from New England points. Within 1.5 miles of Rock Hill are six lakes, besides numerous trout streams, making this town deservedly popular as a fishing ground.

At Ferndale the road crosses the east branch of the Mongaup river, the scenery around which is wild. Liberty falls, nearby, have an added interest. Lake Ophelia at Liberty is a pretty sheet of water, and the highlands about this region form a chain of foothills extending to the Catskills, 20 to 40 miles distant, although in plain view, from the broad plateau on which the town is located.

Parksville is in the heart of an immense trout country. Livingston Manor, at the junction of the Willowemoc and Little Beaverkill rivers, is situated in a wide valley, and the surrounding hills lend

Digitized by Google

Chestnut Point at the Head of Lake Hopatcong, N. J.

much to its attractions. Among the points of interest are the celebrated Eastman, Marguerite and Woolsey falls, near the highway.

It is said to be worth 10 years of city life to spend a week among the trout haunts in the vicinity of Cook's falls. At East Branch the Beaverkill pours its spring waters into the Delaware, and bass fishing is said to be the best in the state. The remainder of the distance into Binghamton is by way of Hancock, Rood's Creek, Deposit, Damascus and Windsor.

CROSSING MOUNTAINOUS PENNSYLVANIA.

Part of the Transcontinental Route from Philadelphia Westward to Pittsburg, Thence to Lake Chatauqua and Buffalo and Return Over the Poconos.

CROSSING and recrossing the mountains of Pennsylvania, the itinerary outlined as No. 50 will make its appeal to those who enjoy rich scenery and are not adverse to testing the merits of the car. The start is made from Philadelphia, and it is possible to utilize portions of this itinerary in making a transcontinental tour from almost any point in the East.

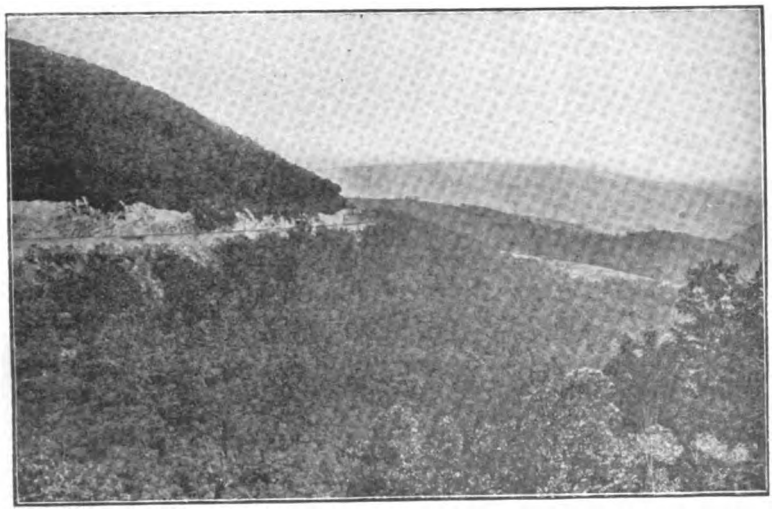
Philadelphia is left by way of the beautiful Fairmount park. Bryn Mawr is the seat of Bryn Mawr College for girls. Paoli is the scene of an American defeat in 1777. Fine views of the Chester valley are obtained a little later. Lancaster was the state capital from 1799 to 1812, when it was removed to Harrisburg. The Susquehanna is crossed at York, which is noted for its slate quarries and old sulphur springs.

One of the Many State Monuments on the Gettysburg Battlefield.

Gettysburg is the most elaborately and accurately marked battlefield in the world, having more monuments and memorials than all other battlefields combined. The National Cemetery is a beautiful spot and the night's stay in this historic environment is none too long. It is possible to locate the points at which the different detachments of the opposing forces made history in the memorable conflict. Seminary ridge, guarded here and there by guns; Cemetery hill, with its earthworks still intact; Culp's hill, with its battle scarred trees; Cemetery ridge, with its long line of monuments; Devil's Den, with its bullet marked boulders; the Peach Orchard, the Whirlpool of Death and the Bloody angle, are all spots that every American desires to visit.

Splendid mountain scenery compensates for the poorer roads leading to Bedford. Chambersburg was the site of Lee's camp, when he decided to march on Gettysburg, and the second day's route thus reverses that taken by the Confederate general after destroying the stores at Chambersburg. Near Bedford are the famous Bedford springs, and some excellent drives are to be enjoyed in this vicinity. Most tourists will desire to make this the night stop, proceeding to Altoona in a separate stage.

The road to Altoona is gradually being turned into macadam. While it is possible to make direct connections with Pittsburg from Bedford, it is more desirable to take the longer itinerary outlined herein. The way leads along the Alleghenies for the entire length. Beyond Altoona the roads are by no means the best in the country, although the rich mountain views obtained amply repay the tourist for visiting the section.



Pittsburg is best known as the Smoky City, and is famous for its steel works. It was settled in 1753 by the French, who built a line of forts along the Ohio and Allegheny rivers, that at this point being named Fort Duquesne. This was destroyed in 1758, and later was succeeded by Fort Pitt. The history of Pittsburg as such dates from 1765. Its commercial advantage is gained through the fact that it is in the centre of the richest coal district in the world.

Across the river is Allegheny, formerly a separate municipality, but incorporated with Pittsburg in 1897. Here may be seen Phipps Conservatory, ranking among the finest in America; the Carnegie Institute and the Carnegie library. In Pittsburg itself is located the Allegheny county court house, the main tower of which is 420 feet high and commands a splendid view of the valley.

The road to Sheffield and Warren is through the oil fields. There are some charming mountain views on the way to Butler, after which the tourist will find plenty to occupy his attention in studying the oil wells. After leaving Warren the next point of interest is Lake Chautauqua, one of the most remarkable sheets of water in western New York. The lake is nearly 20 miles long and although but seven miles from Lake Erie, is 720 feet above its level and its waters flow into the far-away Gulf of Mexico.

Several well known resorts are located on this lake, but perhaps the best known is that of Chautauqua. This is the home of the world renowned Chautauqua literary and scientific circle, where summer after summer, students from all over the world assemble, in the midst of surroundings

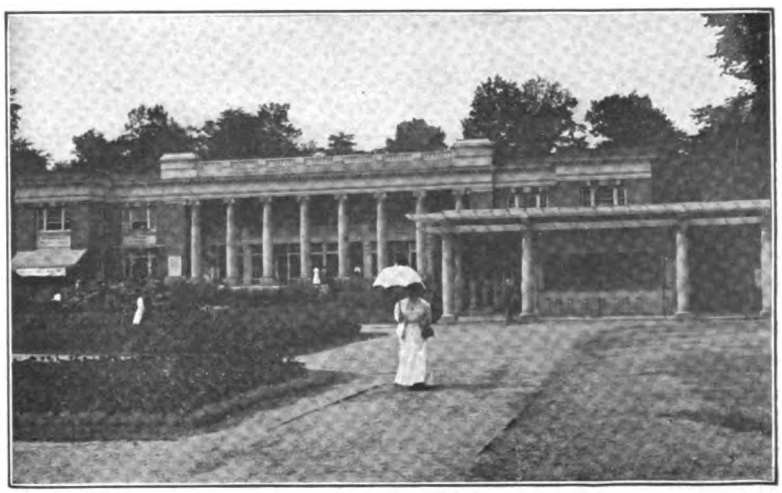
The Allegheny Mountains of Pennsylvania Present Magnificent Views.

which cannot help but stimulate, and pursue their studies of the languages and scientific subjects.

Jamestown, at the eastern extremity of the lake, is only a short distance from Celoron, which resembles very much a seacoast resort. Excellent opportunity is offered for fresh water bathing, boating and fishing. All of the various resorts on the lake are connected by steamboats.

The route from Westfield to Buffalo is a portion of the main transcontinental route from East to West, or vice versa. At Buffalo the tour turns back toward Philadelphia, touching at Silver Springs, near Silver lake, practically the most western of the chain of small lakes in central New York.

Portage has a history dating back to Indian days. The settlement was so named because of the fact that the Indians were compelled to carry their canoes around the falls of the Genesee river. At this point the river makes three separate falls, at some little distance apart, and offers a pleasing sight. A splendid railroad bridge now replaces the portage at a considerable height, giving a view of all three.



Dansville is in the centre of the hop growing country, and for miles the fields appear on either side of the road. A little later the tour enters the grape country, in the valley of the Canisteo river, and during the remainder of the distance into Elmira luscious fruit tempts the tourist on every hand. Incidentally, it may be stated that this district is somewhat noted for its wine cellars.

Beyond Bath is Corning, with its cut glass factories. Then comes an excellent macadam road, along the Chemung river into Elmira. This night stop first became a permanent settlement in 1788, and was incorporated as the village of Newton in 1815. The name was changed to Elmira in 1828. It is now the seat of Elmira College and other institutions of learning. Perhaps it is best known as the site of the state reformatory. Its chief industries are rolling mills, railroad car shops, steel bridge works, automobiles, etc.

For the first 20 miles beyond Elmira the tour lies along the Pennsylvania line, before it finally crosses it at Athens. From this point mountains begin to make their appearance. The route is along the Susquehanna river and affords some excellent scenery all of the way. The Lehigh Valley railroad here winds its way among the peaks in a manner almost miraculous and adds its share to the general picturesqueness. Perhaps the view is at its best at Tunkhannock, but the tourist will find sufficient cause for rejoicing all the way.

The night stop is at Wilkesbarre, located in the Wyoming valley. This is the shipping point for the rich and extensive anthracite coal beds in this valley. It was founded in 1769 and occupies a commanding position in upper Pennsylvania. A short distance to the west is Eagles Mere, or the "Lake of the Eagles." This is situated 2200 feet above sea level and is embedded like a brilliant emerald among the virgin forests. It is 1.5 miles long and one mile wide, and in many places 60 feet deep. Excellent opportunity for bathing is afforded, the beaches being covered with clean, sloping white sand.

More mountains are encountered on the way back to Philadelphia, these being known as the Poconos, one of the groups which go to make up the Blue Ridge. They share with the Catskills and the mountains of West Virginia and North Carolina, an average altitude of 2000 feet, with heavily wooded slopes, through which brightly rushing streams leap from crag to crag. The end of the journey is over better known ways in the Delaware river valley over the latter portion of the route from Delaware Water Gap as listed in itinerary No. 51.

Colonnade and Pergola at Point Chautauqua, N. Y.

OVER THE HILLS INTO NEW ENGLAND.

An Itinerary Outlined to Connect with Philadelphia and the South by Avoiding the Heavily Congested Traffic in New York City.

IN RESPONSE to the growing demand for an itinerary connecting New England with the South without the necessity for crossing New York City, that outlined herein has been selected as presenting features which will win instant approval. Many tourists, particularly women, find driving in the Metropolis to be a severe test of their nervous temperament. Tour No. 51 may be used in combination with any of the itineraries connecting these two sections of the country.

Leaving Philadelphia, the way leads first to Camden, N. J., thence to Burlington, where Howe defeated Washington in 1777, resulting in the British occupancy of Philadelphia. Near here the Pennsylvania state fleet of 27 gunboats bravely fought the British squadron as it attempted to ascend the Delaware.

Bordentown was selected by Joseph Bonaparte, a brother of Napoleon, who made him king of Naples, as a refuge after the disaster at Waterloo. He purchased an estate of 1400 acres, just north of the city and lived there until 1832. Later the state purchased the property and it is now known as Bonaparte park.

Beyond Trenton, the state capital, is Princeton, the site of Princeton University, founded in Elizabeth in 1746, and removed to this city in 1757. The battle of Princeton was one of the early and signal successes of Washing-

Digitized by Google

ton's campaign against the British. Nassau hall was utilized as a barracks for a time during the war and later the Continental Congress held sessions there.

The night stop is at Suffern, pleasantly situated among the Suffern hills, more of which are traversed the second day on the way into the valley of the Hudson, which is crossed by the Nyack ferry into Tarrytown. The route then leads across Westchester county into Connecticut.

Near Greenwich is an old cemetery where stood the church around which Gen. Israel Putnam and his band of 60 men fought off the British as long as possible, and then, since leaving by the highway would expose him to danger, he drove his horse down a flight of stone steps. The next day Gen. Putnam made a successful attack upon the enemy at Stamford.

This tour continues along the so-called shore line to Bridgeport and New Haven, passing a number of pleasantly situated seaside resorts, thence by way of North Haven with its many brickyards to Wallingford, famous for the part its silversmiths have played in the industrial history of the country. The hanging hills are passed on the way to Meriden, also well known in the silver business. West Peak, near by, commands a view extending from Hartford on the north to New Haven and over Long Island sound on the south.

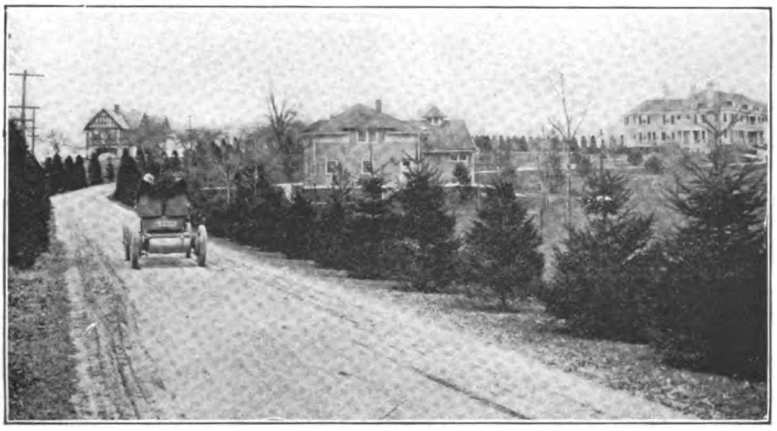
Berlin is accredited with being the birthplace of the tin making industry in America, the first tinware having been produced here in 1775. For many years it was the home of a large number of tin peddlers who traversed the entire country from Mobile, Ala., to Montreal, Que.

The route from Hartford, the state capital, northward to Springfield, Mass., is on the east side of the Connecticut river, and the return is on the west side, thereby affording ample opportunity to enjoy the splendid roads and the particular beauty of the rich tobacco country. After the return to Hartford the tour turns westward along the Farmington river, through Satan's Kingdom with its wild tumbling waters, and into the Naugatuck valley at Winsted.

Then begins the ascent to Norfolk and Canaan, over some of the highest land in the state, and with a sweeping view of the Berkshire hills to the north and the Litchfield hills to the south. Many caves of unknown extent are to be found in these hills, which overlook a number of pretty little lakes. At Salisbury, the iron mines will attract deserved attention. Lakeville shelters an interesting summer colony of New Yorkers. More iron mines are passed on the way to Sharon, and the tour then enters New York State, for the night stop at Poughkeepsie, the seat of Vassar College for girls.

Crossing the Hudson the itinerary enters some of the most interesting country in the vicinity of the Catskills. New Paltz, on the west bank of the Wallkill, was settled by Huguenot refugees from France in 1683. Many of its old stone houses, with high, steep pitched roofs, remain today much the same as when they were erected over 200 years ago. The surrounding country, with its smiling, well tilled fields and vine clad hillsides, still bears the imprint of the thrifty Frenchmen, who reclaimed it from the wilderness.

Napanoch is a favorite resort of artists, who take particular pleasure in transferring to canvas the many charming views of the section. Ellenville is located right under the shadow of the Shawangunk mountains, which rise to a height of 2500 feet and are crowned with castellated, massive bluffs, stretching for miles along their crest. Summitsville overlooks the entire length of the Mamakating valley.



Wurstboro was first settled by the Dutch in 1660, and is surrounded by a number of lakes, which furnish excellent fishing grounds. The same may be said for Westbrookville and Cuddebackville, on the way to Port Jervis. The last named may be regarded as the hub of the summer resort region. It is at the junction of three states—New York, Pennsylvania and New Jersey—this point being on a rock at the confluence of the Never Sink and Delaware rivers. Other points of interest are the old Barrett toll bridge and the Indian fort in the northern part of the town. Pretty drives may be taken into the Never Sink valley, Hawk Nest road and Saw Kill falls.

Dingman's Ferry is near Dingman's Falls, the prettiest in Pike county. These are four in number, the highest being Soap-

Mts. Tammany and Minsi in the Delaware Water Gap.

Westchester County's Splendid Roads at Briarcliff Manor, N. Y.

Trough, while Silver Thread has a sheer drop of 150 feet. A thick growth of forest completely arches the falls, forming a sort of natural tunnel, up through which one may see only a scrap of blue sky.

At Delaware Water Gap, the Delaware river flows between two high mountains. That on the Pennsylvania side is named Minsi, but that on the Jersey shore has the more commanding cognomen of Tammany, although it goes without saying that such has not always been the case. The tops of these peaks are each over 1600 feet from the bed of the river.

Bethlehem offers much of historic interest, as well as considerable picturesque scenery, notably the very old Moravian school and cemetery, the latter with the grave of Uncas, mentioned in more detail elsewhere. Splendid views reward the tourist throughout the remainder of the distance into Philadelphia.

ENCIRCLING THE STATE OF NEW JERSEY.

Following the Coast Line from New York to Cape May, Thence Along the Delaware Bay to Philadelphia and Return Over the Main Trunk Line.

SINCE New Jersey lifted the ban against non-resident automobile owners, motorists have found it rich touring ground. The itinerary presented herewith offers opportunity for visiting the entire coast line from New York City to Cape May, thence along Delaware bay to Philadelphia, and back to New York over the main route across centre of the state.

The outward journey crosses Staten island and enters New Jersey at Perth Amboy. Red Bank, on the Navesink river, is a famous yachting resort. Long Branch is one of the best known watering places in the United States and derives its name from the "long branch" of the Shrewsbury river near by. During President Grant's administration Long Branch was the summer capital, and President Garfield died in the cottage at Elberton.

Asbury Park is another popular seashore resort, adjoining which is Ocean Grove, once covered with the tents of the Methodist Association, but now the summer

Where the Delaware River Has Worn Its Way Through the Kittatinny Mountains at Delaware Water Gap.

Digitized by Google

headquarters of bishops and deacons. No intoxicating liquors are allowed on the grounds and on Sundays all traffic of whatever nature is prohibited.

Lakewood, in the heart of the pine woods, is a winter as well as a summer resort, and there are numerous drives in the pine forests of that section. Georgian Court, the summer residence of George Gould, with its famous Italian gardens, etc., is within easy driving distance.

Atlantic City is situated on Absecon island, a sandy strip separated from the main land by salt marshes. Perhaps it is the best known seaside resort in America and hundreds of thousands of tourists visit it annually. It has nearly 1000 hotels, with accommodations for over 300,000 guests. Besides the famous board walk there are five piers extending into the ocean from 500 to 3000 feet, these being plentifully supplied with amusement pavilions, theatres, etc.

Cape May lies at the extreme southern end of the state, and was named for a Dutch navigator, Carolus Jacobsen Mey, who rounded the headland in 1623. Like Atlantic City, it has its board walk and piers, although on a somewhat smaller scale. The route from Cape May to Philadelphia lies through the rich market gardening country, which supplies the produce for that market.

The return to New York is over one of the most frequently used routes between the two cities, and offers a pleasant alternative to that given in itinerary No. 51 for those who desire to reach the New England territory and do not object to the congested traffic of the Metropolis.

CROSSING THE MASON AND DIXON LINE.

A Three-Day Tour Designed to Afford Connections Between Washington, Philadelphia and Gettysburg, and Between the North and South.

OFFERED as the connecting link between the South and the North, itinerary No. 53 starts from Washington and visits Philadelphia and Gettysburg. It thus provides two means of communication between these two sections of the country, either of which may be followed with profit by the tourist who enjoys interesting scenery and good roads.

As outlined, the route from Washington to Philadelphia follows the main trunk line through Baltimore, Md., and Wilmington, Del. Good macadam marks a major portion of the way. Baltimore is one of the chief oyster packing centres of the world. It is a manufacturing city of importance and has a number of fine public buildings. Druid park, a 700-acre plot, with varied native forests, is beautifully laid out and contains a number of fine drives.

At Havre de Grace, the Susquehanna river is a full mile wide. At Perryville the road crosses a long railroad span, which has been transformed into a highway. Wilmington is noted for its parks, one of which is located in the Glen of the Brandywine, a name which is familiar to students of the Revolution, and another is Rockford park, where a handsome statue of Thomas F. Bayard is to be seen. Here also is to be found the famous Dupont powder works. The old Swedes Church was built in 1698 by the first Swedish colony to locate in America.

Along the Pennypack River in Southern Pennsylvania.

The route from Philadelphia to Gettysburg is identical with that offered for the first day in itinerary No. 50.

Emmitsburg, just across the Mason and Dixon line, is the seat of Mt. St. Mary's College, a Catholic institution, which was founded in 1808, and which has a reputation that is world wide. The Mother House of the Sisters of Charity is two miles distant.

Frederick, laid out in 1745, is in the centre of a rich limestone plain near the Catochin mountains, thus accounting for Whittier's "Green-walled by the hills of Maryland," in "Barbara Frietchie." The city was the terminus of a railroad opened in 1830, the grading work for which was done by Charles Carroll of Carrollton, then the only living signer of the Declaration of Independence. It was at Frederick that Lee established himself after defeating McClellan in 1862 and called upon the people of Maryland to rise against the Union. The people refused to obey and McClellan was able to dislodge him with 70,000 men. Francis Scott Key, the author of "The Star Spangled Banner," is buried in Mt. Olivet cemetery.

The remainder of the trip into the National Capital is over good macadam road and through interesting historic country.

DELIGHTFUL TOURS IN THE SOUTHLAND.

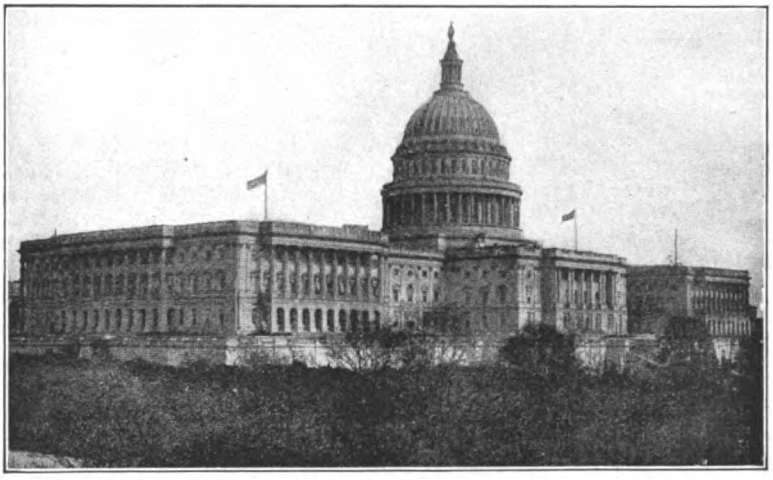
Washington-Atlanta-Tuscumbia-Nashville-Louisville-Cincinnati-Wheeling-Pittsburg-Washington—Atlanta-Savannah-Jacksonville—Tuscumbia-Memphis-New Orleans.

ROAD conditions in the South have improved decidedly since the running of the 1911 Glidden tour, and it must not be forgotten that the Atlanta-New York tours of 1909 and 1910 did their full share to bring the value of improved ways to the attention of the people in this district. The main itinerary outlined herein, No. 100, combines a portion of the 1911 Glidden tour along the Atlantic seaboard, with a portion of the 1910 Glidden in Tennessee and Kentucky. It is anticipated that the tourist will take up this routing at Washington, D. C., and return to that point by way of the Middle West. It may be added that this itinerary furnishes connecting links in two transcontinental tours.

Itinerary No. 101 is given for those who desire to reach Jacksonville, Fla. The start may be made from any point in the North, or any other section of the country for that matter. After reaching Atlanta over itinerary No. 100, the remainder of the route will be found to afford what is regarded as the best means of getting into Jacksonville by automobile. While some of the roads are not to be considered ideal, it may be suggested that there are drives in and out of Jacksonville which are the equal of those in any section of the country. Itinerary No. 102 takes the tourist to New Orleans and the same thing holds true of this in a measure. The Louisiana cities hold much of interest for the tourist.

Respecting the main tour, it may be added that the route lies through some of the richest historic sections in the South, with splendid views on the way to Atlanta from Washington, and again in Tennessee and Kentucky. The return to Washington from Louisville follows somewhat closely the old national highway in places. There ought to be little difficulty experienced in making the daily mileage as outlined.

ITINERARY NO. 100.



Night Stops—Washington, D. C.; Richmond, Va.; Henderson, Winston-Salem and Charlotte, N. C.; Greenville, S. C.; Atlanta, Ga.; Birmingham and Tuscumbia, Ala.; Nashville, Tenn.; Mammoth Cave and Louisville, Ky.; Cincinnati and Zanesville, O.; Pittsburg, Penn.; Cumberland, Md. Sixteen Days, 2150.2 Miles.

ITINERARIES COVERING THE MIDDLE WEST.

Buffalo to Chicago and Return by Way of Detroit and Canadian Points---Detroit to Cincinnati, Indianapolis and South Bend---Chicago-Indianapolis-St. Louis.

WHILE the Middle West does not offer the scenic grandeurs of New England and the East or the Pacific Coast and the Far West, there is abundant reason for outlining the itineraries presented herewith, aside from the desire to present additional routings which may be utilized in making transcontinental tours. An effort has been made to include in these itineraries a section of the country which not only will appeal to those who are making through tours, but those who are searching for good roads and plenty to divert the attention.

Itinerary No. 125 is outlined to connect Buffalo with Chicago over the so-called main transcontinental route. The return offers an option, with opportunity to visit some of the interesting centres of the industry, including Detroit, and a decidedly picturesque portion of Canada. The roads, both going and returning, are of such character as to leave no room for criticism.

Itinerary No. 126 connects Detroit with the South, and while it will be found that the first portion of this tour, as outlined, passes through that section of the Middle West which was visited by disastrous floods earlier in the year, advices received within a few days indicate that the condition of the roads is such that the tourist need have no hesitancy in attempting the trip. In the vicinity of Dayton, many bridges were washed away, but it is stated that most of these have been replaced with temporary structures, and where this has been found impracticable, ferries are being maintained for the present.

The road between Cincinnati and Indianapolis is said not to have been affected seriously. Advices from Indianapolis within the past few weeks state that no trouble should be experienced over the route selected. There is a shorter route between Connersville and Indianapolis, but it is understood

Digitized by Google

that in one or two places this will offer some difficulties for the present. The route selected presents good macadam throughout a greater portion of the distance between the cities named.

Itinerary No. 127 offers the transcontinental tourist two options. Going from east to west, Indianapolis may be reached by way of Pittsburg and Cincinnati, utilizing other itineraries mentioned herein. The connection between Indianapolis and St. Louis is that being utilized by the Indiana Manufacturers' Association. Those who desire may follow the main transcontinental route to Chicago and then go to St. Louis by reversing the latter portion of this itinerary.

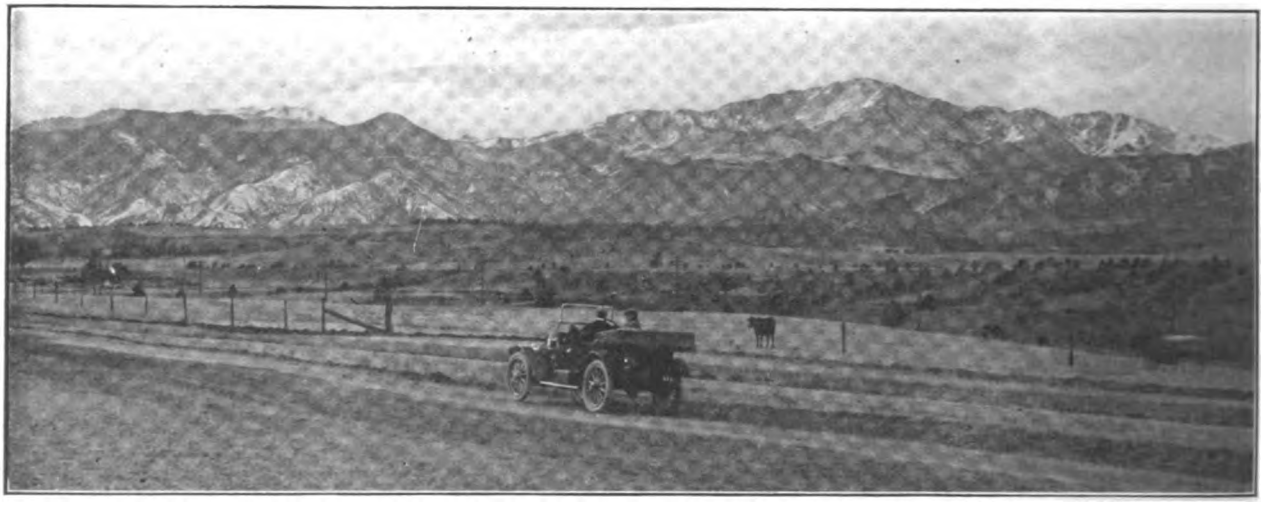
THE FAR WEST AND THE PACIFIC COAST.

Suggestions for Transcontinental Touring, Reaching the Great Northwest, Traversing the Coast Line, the Rocky Mountain Districts and Entering Manitoba.

WITHIN the past few years the people of the Far West have done much to encourage transcontinental touring by the construction of good roads. The eight itineraries outlined in this section are believed to include all that could be desired in this respect, although it will not be contended that improved ways are to be found throughout their entire length. The accompanying map indicates what may be regarded as the most desirable touring country in these states, although many shorter tours may be enjoyed with several cities as temporary headquarters.

Itinerary No. 150 presents what is sometimes called the main transcontinental route from Chicago. Probably it offers less difficulty than any other crossing the Rocky mountains, and it has the advantage of being available for a larger portion of each year. With the exception of portions of the route in Wyoming and Nevada it is not anticipated that the tourist will experience unnecessary delays or that there will be difficulty in following the route as outlined.



Itinerary No. 151 is offered as an optional route between Los Angeles and Memphis, and is often termed the southern route. Good roads should be encountered in Arkansas and Texas, and in Arizona and California. The difficult portions are in eastern Arizona, New Mexico and western Texas.

Itinerary No. 152 connects St. Louis and Denver, and other routings outlined give the necessary options from this point. It may be added that this is the route to be followed by the Indiana Manufacturers' Association and is of interest because of its historic associations, as well as the improved ways encountered.

Itinerary No. 153 follows very closely that utilized for this year's national reliability tour. That portion between Minneapolis and Helena was used by the Minnesota State Automobile Association for its tour in 1911. The first section offers no difficulties, the roads being of macadam for the most part. Crossing North Dakota and Montana is to be attempted with caution, and it may be added that it were best to have at least two cars in the party. Accompanying this itinerary is a routing connecting Grand Forks, N. D., with Winnipeg, Man.

Itinerary No. 154 connects St. Louis with Forrest City, Ark., and affords opportunity for the tourist to utilize the southern tour from the Pacific Coast and return to the Atlantic seaboard by way of St. Louis and Chicago, or St. Louis, Indianapolis, Cincinnati, Pittsburg, etc. In addition it offers another connection with the South from Chicago in combination with other tours listed herein.

Itinerary No. 155 runs along the Pacific Coast south from San Francisco. The opening of the new Rincon causeway makes this route much less difficult than formerly. Itinerary No. 156 connects California with Seattle. Some criticism may be offered in that no connection between Seattle and Helena, Mont., is offered, but

On the Denver-Colorado Springs Highway, Where for Forty Miles the Road Parallels the Mountain Range, with Pike's Peak in the Background.

Digitized by Google

Macadam Way Invites Tourist to View Wonders of Garden of the Gods.

The Automobile Journal is advised that no route now outlined between these two sections is practical for the average motorist. The effort has been to include only such routes as could be attempted by those who are accustomed to average driving conditions, and while transcontinental touring calls for special preparation in any instance, it is not deemed expedient to include itineraries which could not be expected to meet with approval.

Perhaps itinerary No. 157 is in some respects the most difficult of any presented. Advices from Colorado Springs and Phoenix suggest that the roads over this route have been improved very materially, and while there are long distances between habitations in many instances, it is stated that the tourist should be able to make the trip without discomfort.

It seems unnecessary to comment at length upon the scenic grandeurs of the Rocky mountain and Pacific Coast districts. The automobile offers a splendid opportunity to "See America First," and an effort has been made to give the necessary information as to how to reach the principal centres.

The transcontinental tourist hardly will make the journey without frequent stops, and abundant opportunity may be had to enjoy any number of side trips, full information concerning which may be gained upon arrival, although The Automobile Journal is prepared to offer suggestions covering any specific section, not outlined herein, upon request.

within 15 miles of state line. **New Jersey**—Fees, 10 hp, $4.50; 11-29, $7.50; over 29, $15. Driver's and chauffeur's licenses, $2 or $4, according to the horsepower. Reciprocity governs non-resident provision. **New Mexico**—Fees, 12 hp, $2; 12-20, $4; 20-30, $6; 30-40, $8; 40-50, $10; over 50, $12. **New York**—Fees, 25 hp, $5; 25-35, $10; 35-50, $15; over 50, $25. **North Carolina**—25 hp, $5; 25-40, $7.50; over 40, $10. **Oregon**—Fees, 26 hp, $3; 26-36, $5; 36-40, $7.50; over 40, $10. **Pennsylvania**—Additional legislation pending. Fees, 20 hp, $5; 20-50, $10; over 50, $15. **Rhode Island**—Fees, 5-20 hp, $5; 20-30, $10; 30-40, $15; over 40, $25. **Tennessee**—New law now pending before legislature. **Virginia**—Fees, 20 hp, $5; 20-45, $10; over 45, $20. Non-residents are exempt for two periods of seven days each. **Washington**—Lights required during hours of darkness. **Wisconsin**—Additional legislation pending. **District of Columbia**—Ask for copy of police regulations covering speed limitations and streets on which automobiles are not permitted, as well as other special provisions.

The above table and the accompanying notations are held to present the essential features of the motoring laws in the various states as applying to tourists, although several of the states permit local ordinances and regulations. Practically all laws now provide for good and efficient brakes, suitable horn or other signalling device, and that the rear lamp shall display a red light toward the rear and a white light illuminating the number plate. Connecticut, Maryland, Massachusetts, Minnesota, New Hampshire, New Jersey, Pennsylvania, Rhode Island, Vermont and Washington forbid the use of the muffler cut-out. Tire chains are not permitted on certain surfaces, unless the roads are in a slippery condition, in Delaware, Michigan and New Jersey, while Montana expressly requires their use when the road surface is in an unsafe condition.

A WEEK IN THE CHATEAUX DISTRICT.

Splendid French Roads Offer Many Inducements to Study the People---Itinerary Includes a Visit to Normandy and Brittany Before Reaching Paris.

MOTORING on the Continent of Europe is one of the chief delights of the American tourist. Road conditions, particularly in France, are splendid, and, of course, the scenic beauties are best appreciated when thus approached. The grandeur of the mountains; the points of interest made famous in history, art and literature; the ruins and ancient architecture, all combine in making their appeal.

In outlining the accompanying itinerary, it is anticipated that the visitor will welcome the possibility of seeing some of France and its people before arriving at Paris, which, it is assumed, will be selected as the centre from which other tours will radiate. In the event that this supposition is not correct, the route may be reversed.

Leaving Havre the first day, the way leads over the river road to Harfieur. Those who are visiting France for the first time, may think it a little strange that the better known "Route Nationale No. 14" was not selected, but those who care for country lanes and by-ways will be delighted with the opportunity to gain more intimate knowledge of the towns and villages, as well as the people, than would be possible on the main highway. However, these roads will be found equally as good; sometimes better, as they see less traffic.

One of the Typical Historic Structures in the Chateaux District of France.

Stops undoubtedly will be made at Littlebonne to view the ruins of an old Roman theatre, which is well worth inspection. The ferry to Quillebeuf affords a delightful sail across the Seine with splendid outlooks in either direction. Immediately thereafter the tourist finds himself in the midst of the farming district of Normandy. The road to Bernay is through undulating country and fast time may be made. The night stop is at Mortagne, which is not famous, except that the church tower burned down, and they ring the bells in the streets.

The second day's journey lies across Normandy toward Brittany, and on either side, the road is bordered by hedges for miles. In many places it winds in and out among the hills, affording picturesque views nearly all of the way into Mayenne. Thence, the way will turn southward again toward Touraine, the real objective point of the tour. The night stop is at Laval.

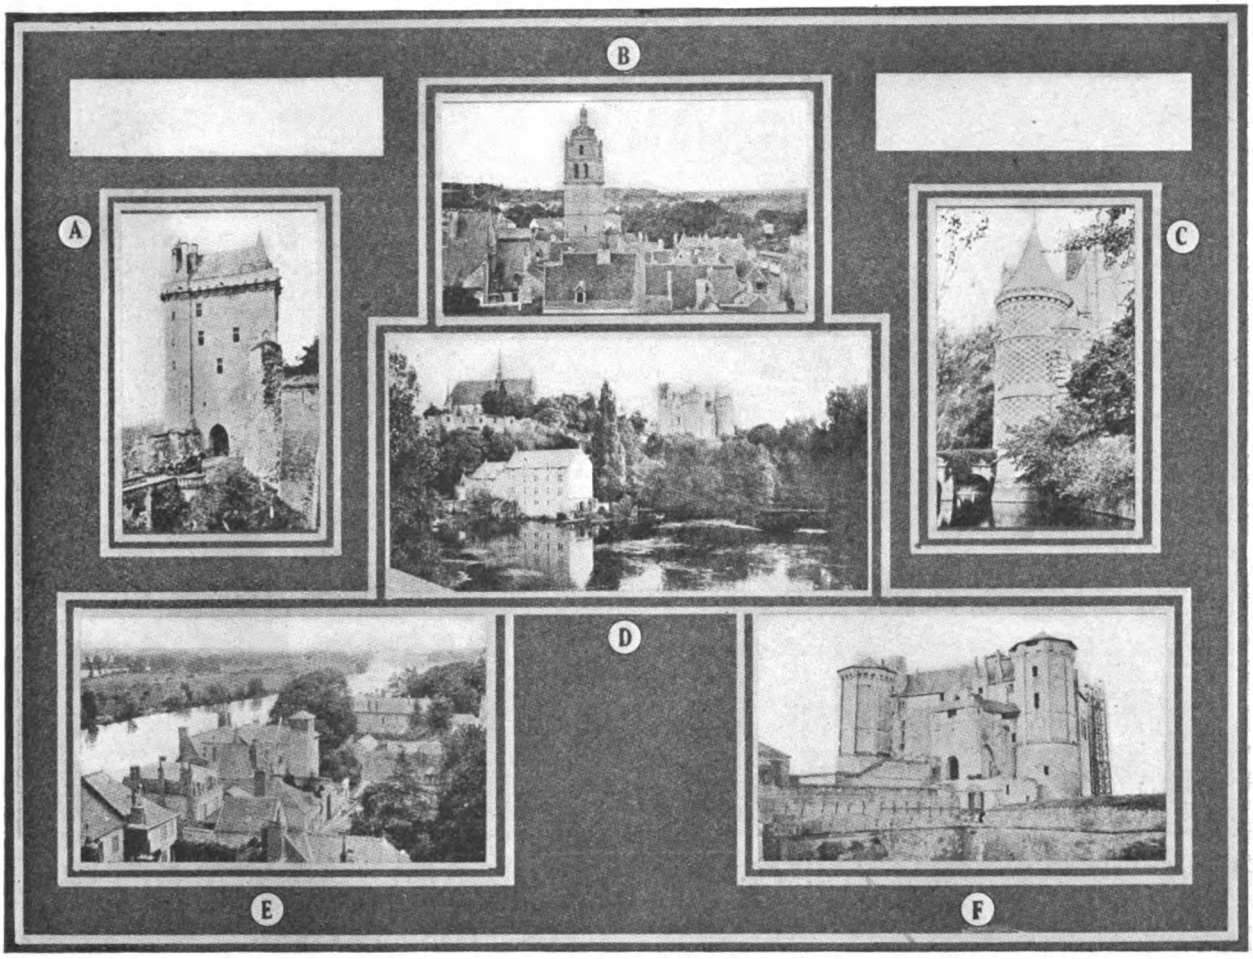
From this town it is only a brief run to Chateau Gontier, the first in a long list of ancient structures, presenting sufficient of beauty and medieval grandeur to cause the motorist many pangs of regret upon leaving. Angers is one of the larger places in France, and is full of interest. Time should be taken to drive in the environs, including the fortress, the statues of Margaret and King Rene, and the Chateaux St. Maurice, Plessis Bourre, Serrat and Plessis Mace. The cathedral was begun during the 11th century and completed in the 13th.

The way is now along the banks of the Loire, and just before reaching Saumur, the night stop, the Chateau de Souzay is passed. This structure is particularly famous because of the death there in 1842 of Margaret of Anjou and Lancaster, heroine of the War of the Roses. Inside the city proper is the old fortress, which is being restored, and a splendid piece of modern work is the bridge across the Loire at this point. It ought also to be added that the Saumur wines are particularly good, and the cellars of the Hotel Budan are one of the important features of the place.

If time will permit the short side trip to Montreuil-Bellay should not be missed. The chateau here contains an ancient kitchen with vaulted roofs and fireplaces, and a fine stairway with handsome arches leads to other rooms, all splendidly decorated and fitted with no end of Renaissance furniture, Venetian glass and old china. The tapestries also are interesting.

Chinon probably is the oldest town to be visited. It is even claimed that it was built by Cain, and that it is the oldest city in the world. However that may be, it is certain the records of the people date back to the fourth century, and St. Mesme came to Chinon before the year 400. In 402, he consecrated the original foundation of the church there.

The town has many places of interest, but none



Digitized by Google

more so than the chateau, with its chimney piece and fire place, the few stones that are left of the room in which Jeanne d'Arc had her memorable interview with Charles VII. This also is the room where, toward the end of the 12th century, King Henry of England drew his last breath. The whole place seems to be permeated with historical memories, and probably that of the Maid of Orleans is most prominent of all.

The route now enters the forest of Chinon to Azay-le-Rideau, where still another chateau is to be found, and Tours. Near the latter town is the Chateau d'Amboise, the greatest charm of which undoubtedly lies in its association with the history of its times.

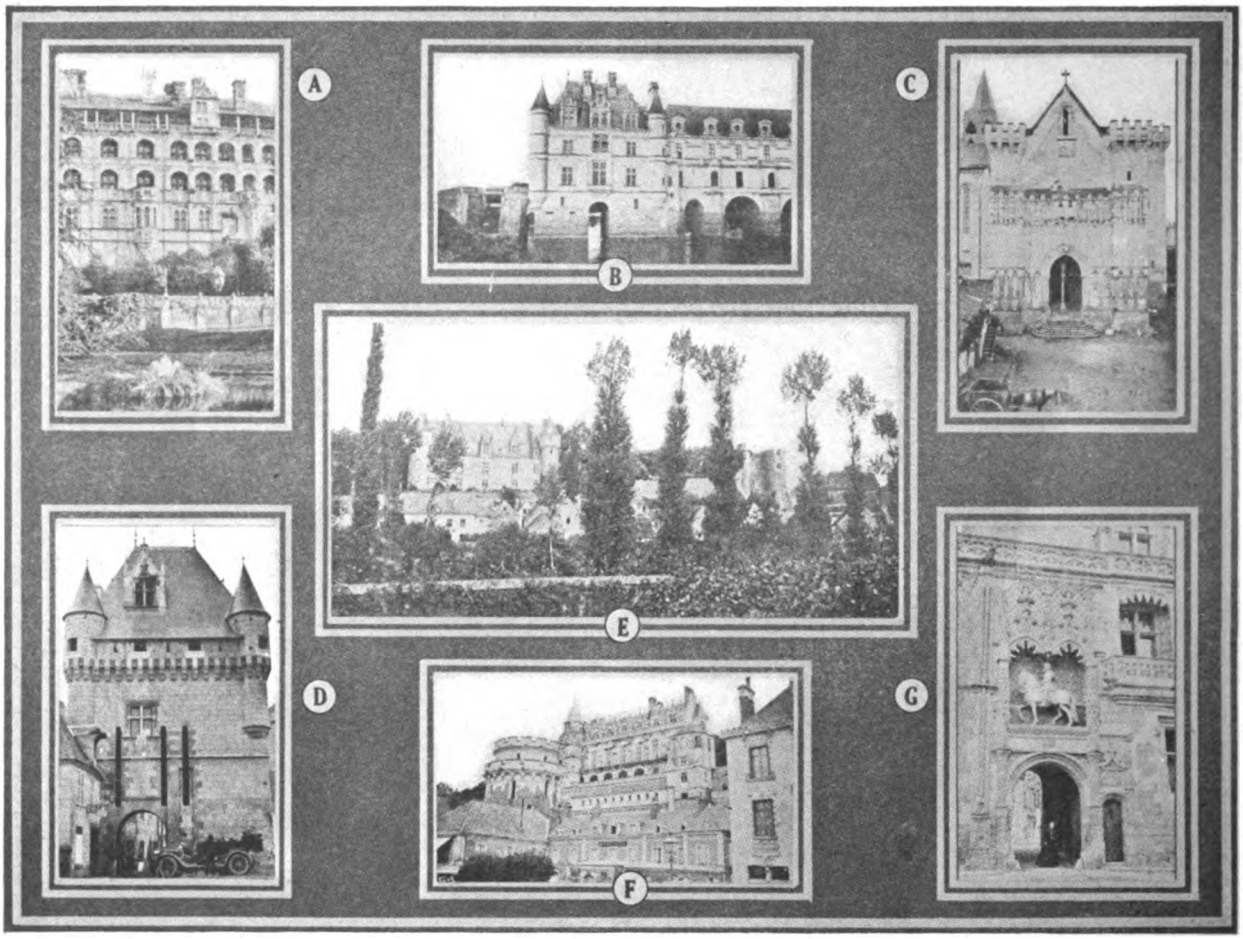
At Montresor, the chateau is in the possession of a Polish count, who with his uncle, has made this a wonderful storehouse of art in connection with the Polish subjects of France. One room is devoted to what is termed the "treasure of Montresor," and is constructed very much like a bank vault, except that it has a window. Built into the walls are glass cases in which stand the solid gold plate of the Kings of Poland. The masterpiece of the lot is Sobieski's soup tureen. Outside are the beautiful gardens, with their fountain and a pond filled with lilies of every description and color.

The road turns northward at Romorantin, and

Views in Touraine: A, Pavilion de l'Horloge at Chinon; B, Loches from the Chateau; C, Castle at Reaux from the Moat; D, Montreuil-Bellay's Castle Above the Thouet; E, the Loire from the Chateau d'Amboise; F, the Fortress at Saumur.

The scene from the top is one of the finest in Touraine.

Then comes Montbazon, with its castle of the 10th century, built by Fulk the Black. The night stop is at Loches, the real feature of which is to be found in the dungeons, credited to Louis XI, and the stories that could be told concerning them are legion. Inscriptions on the walls, steps hewn in the rock to enable prisoners to gain a glimpse of light now and then and the sun dials cut in the stone to enable some hopeless one to keep a rough account of time, will be sufficiently explained by the guide.



Blois is the night stop. The chateau was built by Louis XII, and some of the pictures are well worth seeing. The famous staircase, and the hidden cabinet, controlled by a concealed spring, where Catherine de Medici kept some of her poisons, are among the interesting features.

The real chateaux country is now left behind, although there remain one or two interesting examples on the way through Chateaudun and Chartres, the cathedral in the latter place being worthy of special attention. The roads are still good, and little difficulty

Digitized by Google

will be experienced in making Paris before nightfall. Of course a stop must be made at Versailles, unless it is preferred to reserve this for a side trip later during the stay.

On the return to Havre, the road follows somewhat closely the "Route Nationale No. 14." Near Vernon is Giverny, which is still an artist colony, as it was 20 years ago when Willard Metcalf, Robert Reid and Edward Primmons studied there. Here and there, will be noted a chateau half-hidden away on some hilltop. One of these is the Chateau Gaillard, Richard Coeur de Lion's "Gay Castle." He built it, with its moat, its outer works, its 14-foot walls and most impregnable donjon tower within, in less than a year. For decades thereafter, it commanded the valley and the river against the attacks of the French, finally falling to Philip Augustus after a siege of five months. It is now a most attractive and interesting ruin.

Scenes in Chateaux Country: A, Castle at Chateaudun; B, Fairy Castle on the Cher; C, Church at Candes; D, Chateau of Montresor, Housing Gold Plate of Kings of Poland; E, Gate Tower at Loches; F, Chateau d'Amboise; G, Louis XII Castle at Blois.

Kurt Issertedt, distributor of Overland cars, made by the Willys-Overland Company, for the German Empire, on his recent visit to the Overland factory at Toledo, O., gave some interesting facts relative to the class of competition which the American machines have to confront. Mr. Isserstedt said:

European manufacturers of motor cars are spending more valuable time in trying to belittle American made automobiles than in improving their own production facilities to meet the so-called invasion in the logical way. Not only are they wasting their time in these efforts, but, I am sorry to say, they are playing the game unfairly.

One of the most difficult features of the European opposition with which we American representatives in Germany have to contend is the regular issuance of false statements by Continental motor car manufacturers concerning our cars. Once a month, or oftener, every motor car dealer and owner in the German Empire receives, through the mail, a printed circular which is devoted entirely to criticisms of the American made automobiles. To a great extent these criticisms are not only unfair, but intentionally and deliberately untrue. You Americans cannot realize to what lengths European competitors will go in order to create distrust of your cars.

I have in mind a particularly vicious attack, all the more unjust because there was absolutely no foundation of truth for it. It was an illustration in one of the circulars, showing a man bending a motor crankshaft almost double, across his knee, with apparently little effort. While it was not so labelled, the accompanying reading matter led the unthinking reader to the belief that the illustration was made from an actual occurrence; that the crankshaft was taken from a medium priced American car and was found so poor in quality and construction that a man of ordinary strength actually bent it across his knee.

The Standard Motor Company, Baltimore, Md., Maryland distributor of Cadillac cars, made by the Cadillac Motor Car Company, Detroit, is planning a unique exhibition. F. S. Blivin, president of the company, states there are 250 parts in a Cadillac machine and it is his purpose to have the company's workmen assemble a complete car in the show window, using parts taken from the repair stock.

TEN-DAY TOUR OF ENGLAND AND WALES.

After Leaving Shakespeare's Country, the Itinerary Visits Many Historic Points Before Reaching the Welsh Mountains and Returns by Way of Stonehenge.

FEW English towns are dearer to Americans than Stratford-on-Avon, the home of the immortal bard. The tour outlined herein aims to present an itinerary which will occupy at least 10 days. Shakespeare's country is visited first, after which follows a number of historic spots, and a trip to the Welsh mountains, before returning to London by way of the south country. It is advisable to set aside two full weeks for the enjoyment of the tour, inasmuch as many places are visited which hold much of interest.

Leaving London the first day, the route lies through Kew Bridge to Hampton Court, in which is located a famous palace with gardens, picture gallery, etc. At Stoke Poges is the churchyard, celebrated as the scene of Gray's Elegy. Naturally, the greatest interest attaches to the royal castle at Windsor, which is open to visitors during the absence of the court. Should King George and Queen Mary happen to be at home the tourist will have to be content with looking over the exterior of the building.

Windsor Castle, Home of the British Royal Family.

High Wycombe is an ancient little town, near which is Hughendon, formerly the seat of Lord Beaconsfield (Benjamin Disraeli), who lies buried in the churchyard here. Oxford, one of the two principal university cities of Britain, is at the same time one of the most ancient cities in England. Some of the college buildings still retain their mediaeval character. The cathedral dates back from the 12th century, and its octagon spire is probably the oldest in England, while the cathedral itself is the smallest in the country.

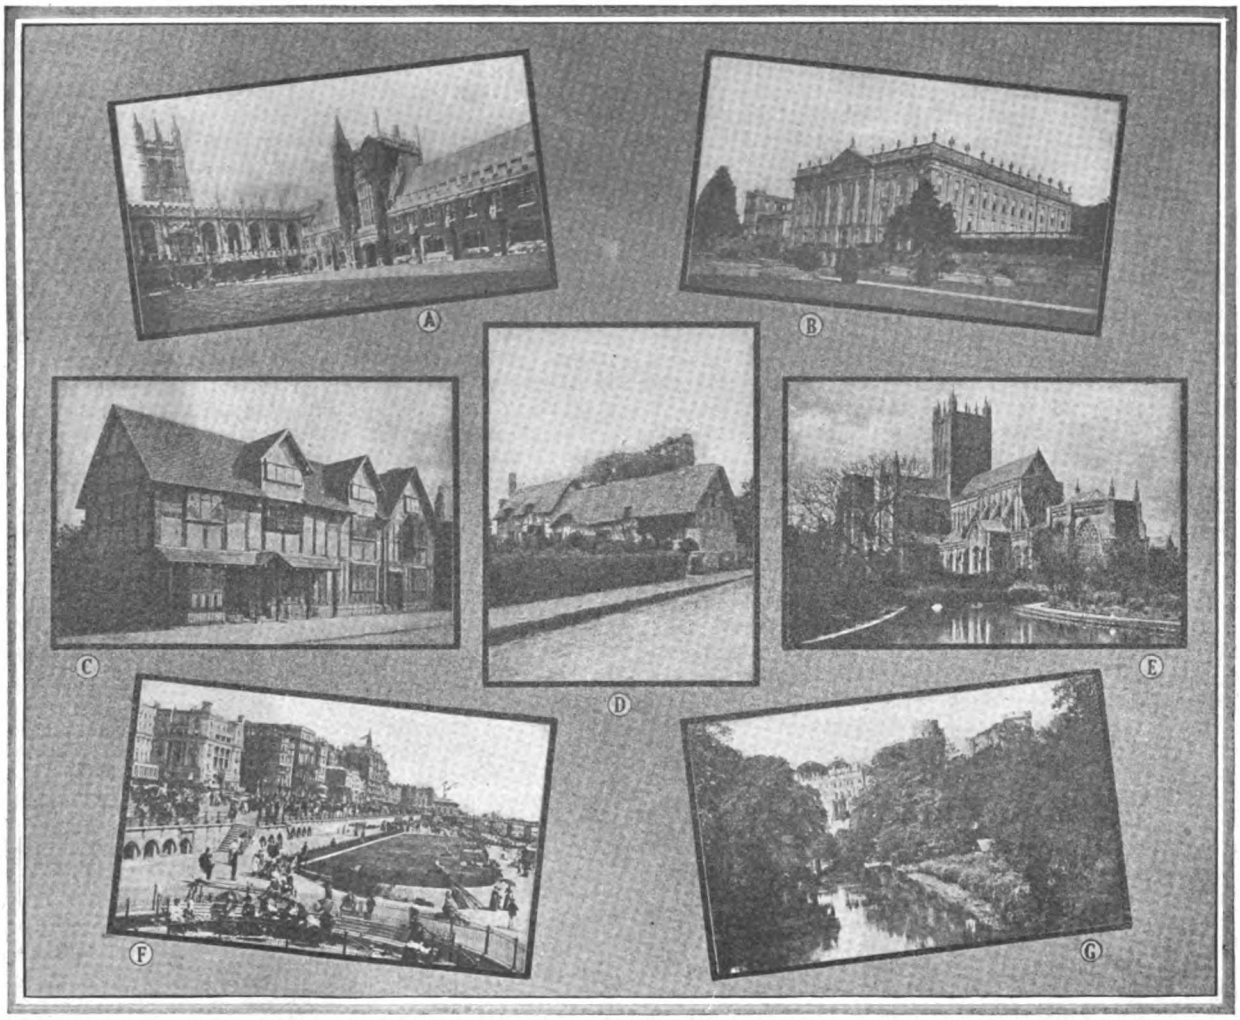
Woodstock is a small, ancient town, the site of Woodstock Manor, the residence of several English kings, although nothing is left of the palace built by Henry I. Blenheim Park is the magnificent seat of the Duke of Marlborough. Here Henry II wooed and won fair Rosamond, under the stately oaks. The park is 12 miles in circumference and well stocked with deer. The castle is a type of Vanbrugh's imposing, though heavy style. The palace contains many rare works of art and tapestries, and the gardens are most attractive. Both are open to visitors Tuesdays and Fridays from noon until 3. Motors are not allowed in the park.

Broadway is a quaint Cotswold village, much favored by American authors and artists. It contains many interesting Tudor and Elizabethan houses. The old Priory and gardens were later the studio of F. D. Millet, the American war correspondent and artist. The old church, dating from the 11th century, is especially interesting. Nearby is the village of Wickhamford, the church of which contains a stone tablet to the memory of Penelope, daughter of Col. Henry Washington, cousin of John Washington, who emigrated to America, and from whom was descended Gen. George Washington, first President of the United States.

The first night stop is Stratford-on-Avon, Shakespeare's town. The house in which the Bard of Avon was born in 1564 is now the property of the nation, and has many interesting relics of the poet. At the Church of the Holy Trinity are the tombs of Shakespeare, his wife, Anne Hathaway, and his daughter, Susan Hall. The Shakespeare Memorial building was erected in 1879. At Shottery, a mile from Stratford, is the cottage of Anne Hathaway, standing in practically the same condition as when Shakespeare courted his future bride. The house contains the carved bedstead, linen sheets, old settle, etc., once the property of Shakespeare's wife.

Early the second day the motorist reaches Warwick, one of the very quaint and historical old towns, the east and west gates of which are still standing. Warwick castle, the home of the Earl of Warwick, is a grand old edifice, one of the finest feudal residences in England, probably dating from the Saxons. The oldest portion existing is Caesar's tower, built soon after the Norman conquest. The interior is open to visitors from 10 in the morning until 5:30 in the afternoon.

Concerning Leamington it is written that it has the cleanest and best kept streets in the kingdom. There are many interesting drives about the place,



Digitized by Google

and in fact all of this region is of great historic interest. Leamington is famed for its mineral springs, and is popular with Americans.

At Kenilworth, Kenilworth castle, founded in the 11th century, is one of the finest baronial ruins in all England, with a very stormy past. A beautiful road leads to Coventry, one of the chief cycle and motor manufacturing towns in England. This is the scene of the famous ride of Lady Godiva. St. Mary's Guildhall, which contains a statue of Lady Godiva, is a most interesting specimen of English municipal architecture of the 14th and 15th centuries.

pied, but still in fair preservation. In the 12th century this place came into the hands of the Vernon's, who held it for 400 years. It is now the property of the Duke of Rutland. At Bakewell, the ancient church contains a monument to Dorothy Vernon. Beyond Bakewell is Chatsworth, open to visitors from 11 to 4, excepting Saturdays, the grand seat of the Duke of Devonshire, built in 1687-1706. Mary, Queen of Scots, was imprisoned here.

Buxton, the second night's stop, is one of the most popular watering spots in England. It has a remarkably bracing climate, and is famous for its hot springs,

Historic English Views: A, Magdalen Cloister and Tower, Oxford College; B, Chatsworth, the Prison of Mary, Queen of Scots; C, Shakespeare's House at Stratford-on-Avon; D, Anne Hathaway's Cottage at Shottery; E, Splendid Early English Cathedral at Wells; F, Along the Esplanade at Brighton; G, Warwick Castle and Caesar's Tower from the Avon.

The cathedral at Lichfield, built in the 12th century, has an almost perfect nave. The city was the birthplace of Johnson and has many literary associations. Burton-on-Trent is famous as the ale making centre of Bass & Co., whose plant covers 200 acres. Matlock is noted for its baths, petrifying wells, caves, etc.

Haddon Hall is a splendid specimen of an old English baronial mansion, open to visitors, unoccu-

which were known to the Romans. They were visited often by Mary Stuart, while in the custody of the Earl of Shrewsbury. The dome of the Devonshire Hospital is said to be the largest in Europe, 154 feet in diameter, and emits a most curious echo.

Macclesfield is a silk manufacturing centre. Chester is said to be the most quaint town in Britain, care having been taken, even in installing modern improvements, to preserve as far as possible the old features

Digitized by Google

of the place. The old city walls are of the 14th century, and extend in a circuit of about two miles with a footway on top.

Eaton Hall, on the River Dee, is the seat of the Duke of Westminster, and is a grand English mansion of the Gothic style, fitted up lavishly. Public admission is granted to the hall and gardens, the latter being especially beautiful. Motor cars are not allowed on the grounds.

At Wrexham, outside the church, built in 1742, is the tomb of Elihu Yale, after whom Yale University in America is named. The night stop is at Llangollen, Wales, at which the bridge over the Dee is described as one of the seven wonders of Wales. A particular point of interest is the ruins of Castell Dinas Bran, perched on an eminence 1000 feet above the river. All around Llangollen are charming walks and drives. The ruins of Valle Crucis Abbey, founded in 1200, is said to be a splendid specimen of pure Gothic architecture.

From Llangollen to Bettws-y-Coed, the route traverses some excellent scenery, which continues on the way to Llandudno, beautifully situated on a narrow peninsula facing Orme's bay and with a fine view of the Welsh mountains. One of the prettiest drives in Wales is that along the cliffs of Great Orme's Head, passing through Happy valley, a distance of six miles. Horse carriages are recommended for this trip, as a motor car is hardly a practical conveyance for the roads encountered.

Conway is surrounded by walls with 21 towers. A commanding view of Snowdon is obtained at Capel Curig. Bettws-y-Coed, the night stop, is very beautifully situated at the confluence of the Conway and Llugwy rivers. This is a highly popular resort for artists and is often called the Paradise of Wales. The Llugwy is crossed opposite the village by means of the Pont-y-Pair, a romantic structure of the 15th century.

Harlech, with its old castle and its splendid view of the sea and mountains, was the last place in North Wales to hold out against Charles I. Aberystwyth, the night stop, is a favorite watering place, from which point the tour turns inland to Rhayader on the River Wye. Abergavenny, another night stop, is termed the Gate of Wales. It is a little town occupying the site of the Roman Gobannium, and contains the ruins of a Norman castle, the grounds of which are open to the public. A rustic gallery on the walls affords a magnificent view of mountain and vale, especially of Sugar Loaf mountain.

The next day's run takes the tourist to the famous Wye valley. The river scenery on the way to Usk is particularly charming. Caerleon is the traditional residence of King Arthur. Caldicut offers a castle with wonderful masonry. In Roman times Caerwent was a city of much importance. Chepstow is picturesquely situated on the west bank of the Wye, with its ruins of the Chepstow castle, dating from the 13th century. Some parts of the town walls and an old gateway still exist.

Tintern abbey at Tintern is considered the most beautiful and romantic ruin in England. It was founded in 1131, and was the third Cistercian church in England. The structure is still preserved, with the exception of the roof and central tower. At Monmouth, the old castle, but little of which remains, was the birthplace of Henry V, the "Prince Hal" of Shakespeare.

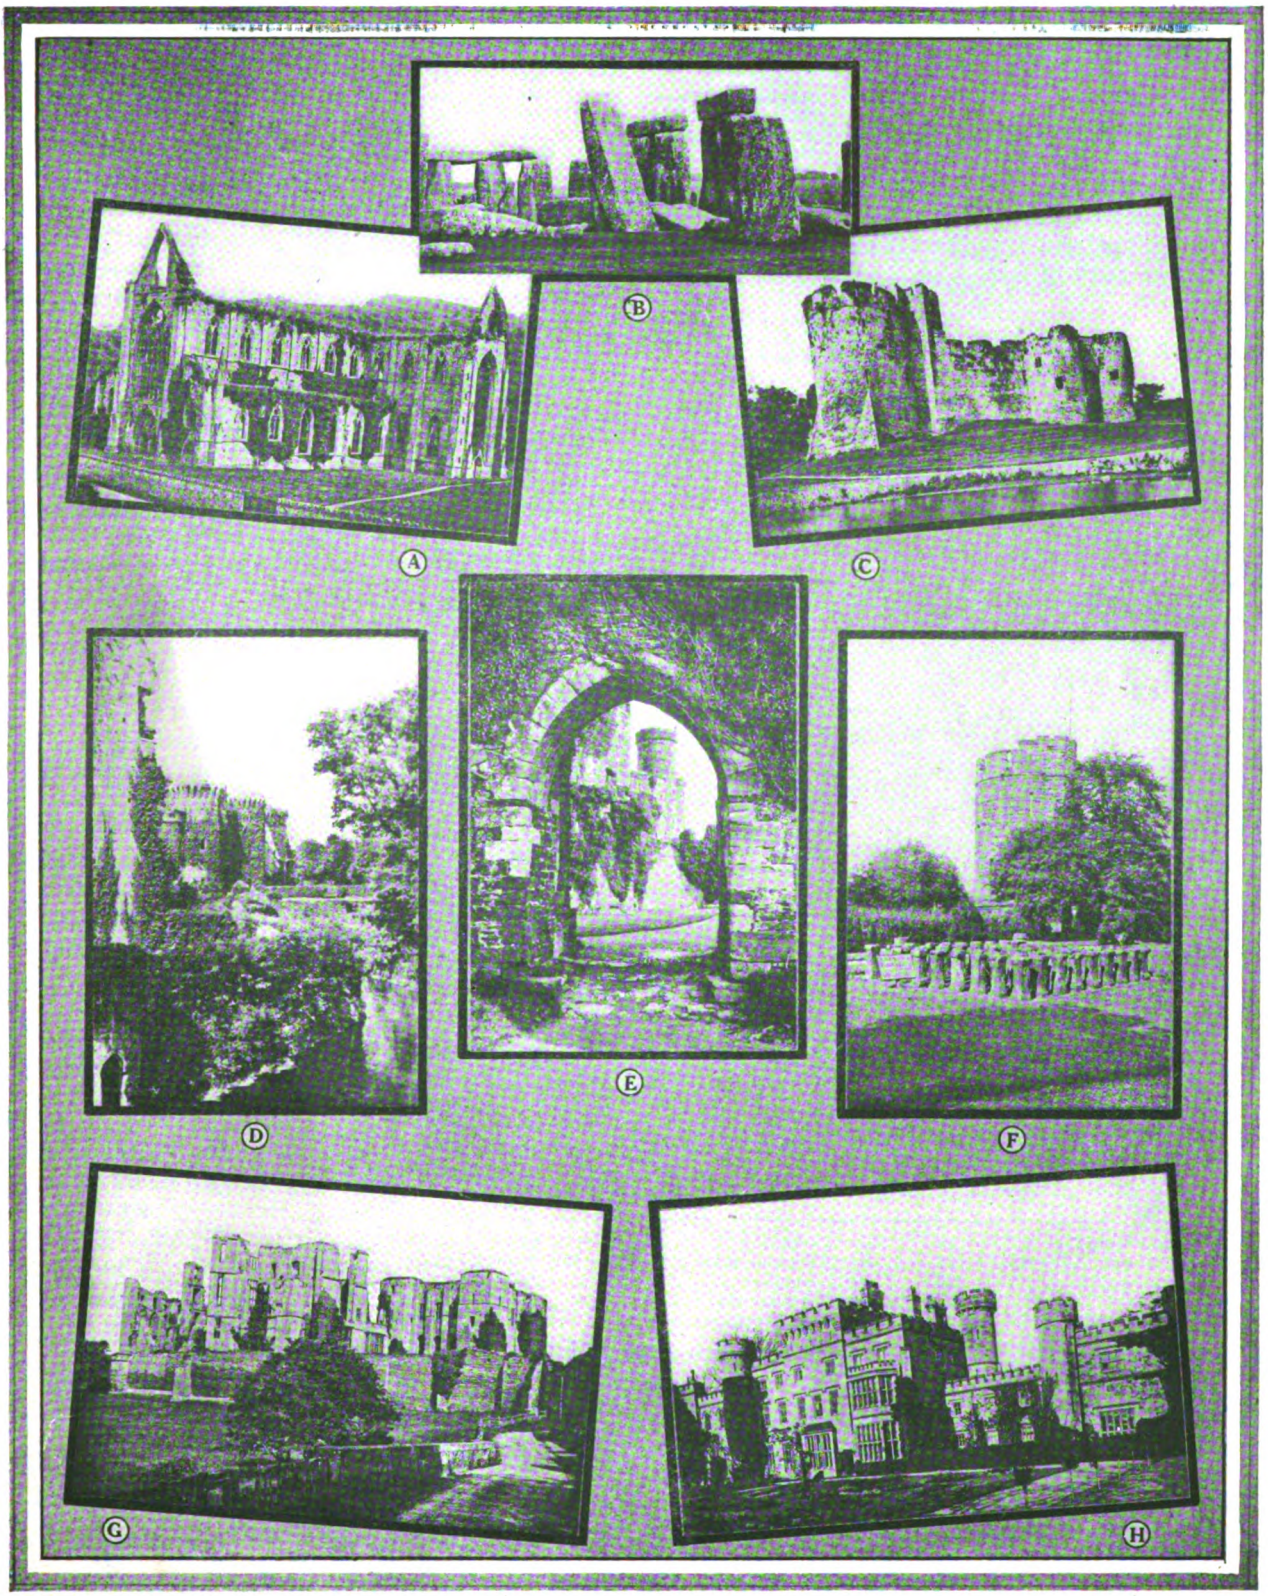
Ross is a pretty little town on the Wye, particularly notable because of its quaint little town hall, supported by pillars of red sandstone. Gloucester is the night stop. The history of this ancient city dates back nearly 2000 years, and is famous for its resistance to King Charles in 1643. Henry VIII was crowned here. The east window in the cathedral, of the perpendicular style, is 72 by 38 feet, said to be the largest in England.

Bath, a combination of the archaeological, historic and scenic, probably ranks first among English towns. The health giving mineral springs are famous, particularly the Roman baths, said to have been founded by Emperor Claudius. The great pump room is a remarkably fine edifice. Guildhall contains many pictures of historic interest.

Wells is a small ancient city, claimed to be the most characteristic cathedral city in England. Although one of the smallest in the kingdom, the cathedral is considered the most perfect piece of Gothic art imaginable. The west front is exceedingly fine and the nave superb.

Glastonbury is noted for the Glastonbury abbey, which traces its foundation back to the sixth century. Longleat is the magnificent seat of the Marquis of Bath, considered the finest Elizabethan mansion in England. Stonehenge is a most imposing megalolithic monument, supposed to have consisted originally of two ellipses of wonderful upright stones. The origin and purposes of Stonehenge are unknown.

Salisbury, the night stop, possesses a cathedral built in the 12th century, a fine example of pure early English architecture. The spire, 404 feet high, is said to be the tallest in England. The Halle of John Halle was built in 1470.



Winchester is a city of great antiquity, and the cathedral, founded in 1079, incorporates every style of English architecture from the Norman to the perpendicular. Winchester college was built in 1373. County Court was erected by William the Conquerer. In the older times Winchester was the capital of the Saxon kingdom of Wessex.

Arundel contains Arundel castle, the splendid seat of the Duke of Norfolk, open Mondays and Fridays from 12 to 4. Brighton, the night stop, is the most favorite seaside resort of the British. The picture gallery contains famous portraits and other pictures. The Royal Pavilion was built for George IV, when Prince of Wales, in 1787. The esplanade is about four miles long.

Lewes is a quaint old town with an old castle of the Norman period and many other interesting places. The return to London is by way of Eastbourne, Uckfield, East Grinstead, Purley and Croydon, over one of the most popular motor trips for English motorists.

It may be explained, in connection with the itinerary outlined on page 86, that an attempt has been made to include the best roads, although in some instances it has been necessary to leave the main highways in order to reach places of historic interest. The daily mileage might be reduced somewhat in some instances by taking the direct route between important centres, but it is assumed that the tourist will desire to view as much of the country as possible, and since all English roads are considered good, when compared with some of the ways traversed in mountain touring in this country, no trouble should be experienced in covering the route selected.

CANADIAN CUSTOMS AND MOTORING LAWS.

RECIPROCITY provisions between the United States and Canada permit the free passage of automobiles under certain regulations. The method of procedure is the same with respect to American or Canadian tourists, except for its reversal. Assuming that the American desires to visit Canada for a period of one week or less, he will proceed as follows:

Stop at United States customs house in order to permit the officer to take note of the number and make other inquiries for the purpose of identification. If the car is to be returned through another port the necessary papers will have to be procured. Stop at the first Canadian customs house and secure a seven-day permit, which will be issued free of charge. If the laws of the province require registration, this detail must be attended to at this time.

If the car remains in Canada longer than seven days, it will be necessary, in order to avoid paying duty, to secure a customs bond, which may be procured at any Canadian customs house. The bond is made out for the double estimated duty based on an appraisal of the car by the customs officer, and must be guaranteed by two Canadian citizens approved by the local collector of customs. In addition a cash deposit of $25 is required, which will be returned at the port of leaving when the car reenters the United States. The bond is good for six months.

A summary of the motoring laws in force in the several provinces covered by this Seventh Annual Touring Number is as follows:

New Brunswick—Registration, annually with secretary of department of public works, Fredericton. Registration fee, $5, plus the following horsepower fees: Twenty, $5; 20-30, $10; 30-40, $15; 40-50, $20. Chauffeur's license, $2. Non-resident owners are exempt 21 days, but chauffeur must have license. Speed, closely built-up sections, 12 miles an hour; other sections of city or town, 15; elsewhere, 20.

Ontario—Registration, annually with provincial secretary, Toronto. Fee, $4. Operator's license, $1. Non-residents are not exempt and the car must bear Ontario number plates only. Speed, within the city limits, 15 miles an hour; outside, 20.

Quebec—Registration, perpetually with provincial treasurer, Quebec. Fees, 25 horsepower, $5; 25-35, $10; 35-50, $15; over 50, $20. Chauffeur's license, $5 annually. Non-residents are exempt if registered in any other province of Canada. Speed, reasonable and proper, closely built-up sections, nine miles an hour; elsewhere, 15. New legislation pending.

WOLVERINE AUTOMOBILE CLUB.

Prominent Detroit Organization Opens Its Magnificent New Home.

Few motoring organizations have enjoyed as much success as the Wolverine Automobile Club of Detroit, which was formed some two years ago to promote good fellowship among the enthusiasts in that city and to boom the product of the Detroit factories. An accompanying illustration presents an interior view of the handsome new home of the club in the Springfield building, 125 Woodward avenue, opposite the Hotel Pontchartrain, where it is expected to become the headquarters for tradesmen visiting the capital of the industry.

Interior of Wolverine Club, Detroit.—Photo by Spooner & Wells, Inc.

The Wolverine Automobile Club has taken a decidedly active part in awakening interest in long distance touring, having successfully managed a run around Lake Erie and a number of runs to important motoring events in Indianapolis, Chicago and other sections of the Middle West. It is rapidly becoming one of the most efficient organizations of its character in the country.

PREPARING FOR THE FOREIGN TOUR.

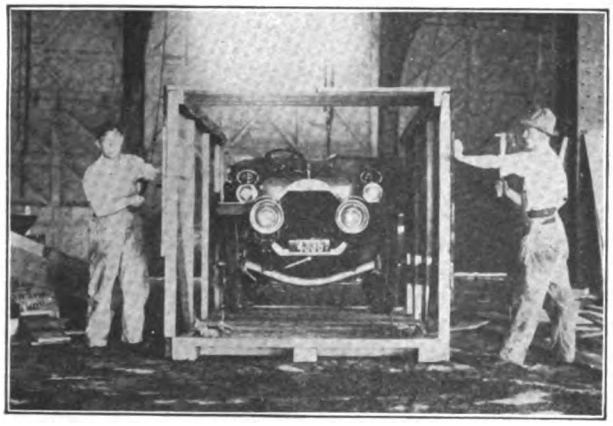
Shipment of Car Has Been Simplified to the Last Degree—Tourist Has Option of Purchasing or Renting Machine Abroad—Taxicab Proposition Considered.

WHILE each American is strongly advised to "See America First," there is little disposition to question the statement that the historical and scenic influences of Europe have a special fascination for the tourist. And it is not surprising that the increased use of the motor car for long distance touring in this country should awaken interest in its possibilities abroad.

The superior roads and the other conditions surrounding motoring in Great Britain and on the Continent are such that no American need hesitate to undertake an automobile trip in any of the more important countries. It is but natural that those who already possess a car should desire to take with them the machine with the operation of which they are thoroughly familiar. However, there are many who suggest that they have found it much more economical under certain circumstances to purchase a car upon arrival and dispose of it upon their return to this country. There also is the possibility of renting a machine, or of engaging taxicabs in each of the important centres visited. An attempt will be made herein to discuss briefly each of these methods.

The Initial Step in the Crating for Foreign Shipment—Constructing Framework About the Car.

It is no longer considered feasible for the owner to do his own crating, not alone because of the difficulties presented due to the lack of information respecting the freight regulations of the various steamship lines, but because of the expense involved. Express companies and tourist agencies, catering to foreign travel, have so systematized this feature that it is extremely probable that the cost will be less than if the work were done by the owner himself. In addition, these concerns arrange all the details so that when the tourist arrives on the other side he finds his car awaiting him with all the necessary papers, triptyques and licenses, with the sole exception of the driving license for France. This must be procured by the operator in person and cannot be obtained without a special examination before the proper authority. But even in this instance full arrangements will be made for taking the necessary examination without delay.

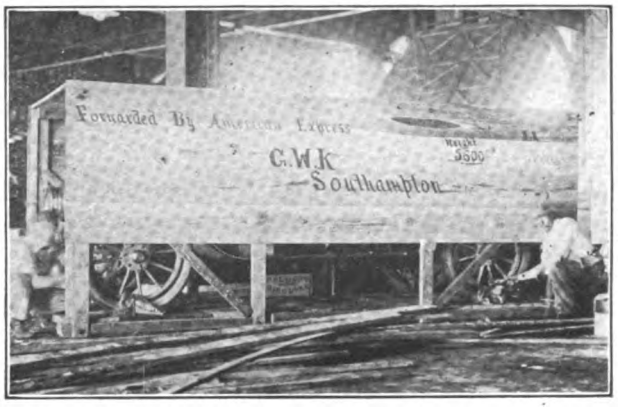


Thus is the shipment of the car simplified to the last degree. The owner is called upon to make choice of the steamship line and arrange with the forwarding company. Some two weeks before sailing he should notify the latter concerning the exact, extreme overall length, height and width of the car, the correct weight, the length of the wheelbase, the bore and stroke, and the manufacturer's number of the motor. While it is possible, under certain circumstances, to make arrangements for crating the machine on the pier, it usually is necessary to deliver it to the forwarding company at least 48 hours before the time of sailing to insure its going by the same boat. It ought also to be said that some of the faster boats do not carry automobiles, but this is a matter which can be determined when consulting the ticket agent before making decision as to the steamship line.

The question as to whether it is better to take the car abroad or purchase one on the other side depends upon the length of time that is to be spent abroad. This factor also enters into the problem when considering the advisability of

Digitized by Google

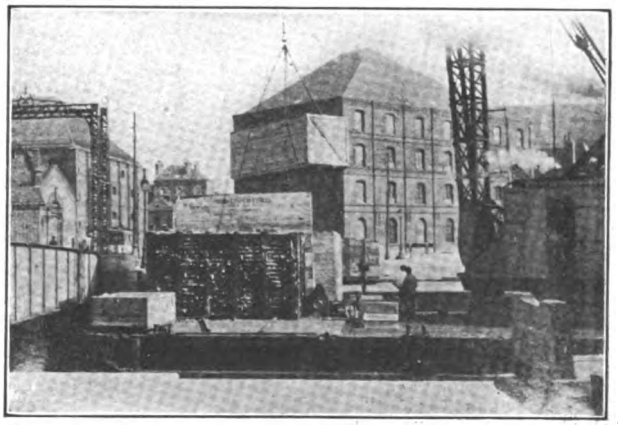
renting a machine. An estimate of the cost of shipping a seven-passenger touring car abroad is placed at about $450 by an owner who has made frequent trips of this character during the past several years. This figure includes all details—freight, licenses, insurance, triptyques, customs bond, etc. It is possible that some of the forwarding companies will quote a price somewhat less than this, some of the items depending largely upon the size and weight of the machine. It will be understood that the purchase of a car in Europe eliminates freight, insurance en route, duty and perhaps a few other items.



Those who decide upon renting a car are cautioned against waiting until their arrival in Europe with the hope of securing a better bargain. Many of the concerns who do a rental business are quite as adept in the art of disposing of unsalable goods as the proverbial Yankee. The contract of rental invariably includes a clause re-

Putting on the Boards at the Side After the Car Has Been Stayed in Place.

quiring the tourist to keep the car in repair. It readily will be seen that it is possible for the renting company to secure much the better part of a bargain under these circumstances.



It must not be understood, however, that this result cannot be avoided. There are a number of reliable concerns in all the principal cities of Europe from whom it is possible to obtain a machine that is first class in every respect. It may be mentioned that Thos. Cook & Son, the well known tourist agency, maintains a rental garage in Paris, and the reputation of this company is sufficient guarantee of its treatment of patrons. There are others of equal prominence, which may be recommended by steamship agencies. While the rental charge may seem greater, the absence of replacements will be found to make the cost much less when dealing with firms of recognized standing.

Showing the Finish of the Enclosure, with the Rest of the Sides and Top Boarded Up, Cleated with Two by Fours and Marked for Shipment.

For those who have limited time at their disposal or those who desire a less expensive means of seeing the country by automobile, the taxicab plan is suggested. In Paris, and in fact most of the larger centres on the Continent, it is possible to rent a private taxicab, so-called, and visit all the points of interest, even at some little distance, at an expense which is surprisingly small.

It should be remembered that the taxicab charges in Europe are very much less than in this country. The private taxicabs are distinguished from those termed public by the color of the flag, which with the former is white and the latter red. The initial charge with the public cab is 75 centimes, while with the private cab it is 85 centimes. This permits a drive of 1300 meters. Thereafter the charges are the same, 10 centimes for each 300 meters. A centime is one-fifth of a cent, and a meter is 3.281 feet, so that the initial charge is 17 cents for the first .8 mile and two cents for each .18 mile thereafter. It would be possible to visit the chatteaux district from

Except for the Differing Aspect of the Docks, Cranes and Laborers, the Unshipping Process Abroad Is Exactly the Reverse—Scene in Havre Showing the Unloading of a Car.

Digitized by Google

Paris, for instance, at a cost of some $20 for taxicab fares.

The tourist who takes his own car abroad, or purchases one upon arrival, should arrange to join at least one of the foreign automobile clubs. It will be assumed of course that he already is a member of the American Automobile Association or the Automobile Club of America, either of which organizations will be able to procure for him a triptyque, a document somewhat in the nature of a club passport, the club guaranteeing the payment of various fees and compliance with the different rules and regulations in the several countries visited. American organizations usually is accepted as sufficient credentials to warrant election to membership in a foreign body. The Touring Club de France is the strongest and the one most used by tourists. Membership therein costs six francs ($1.20).

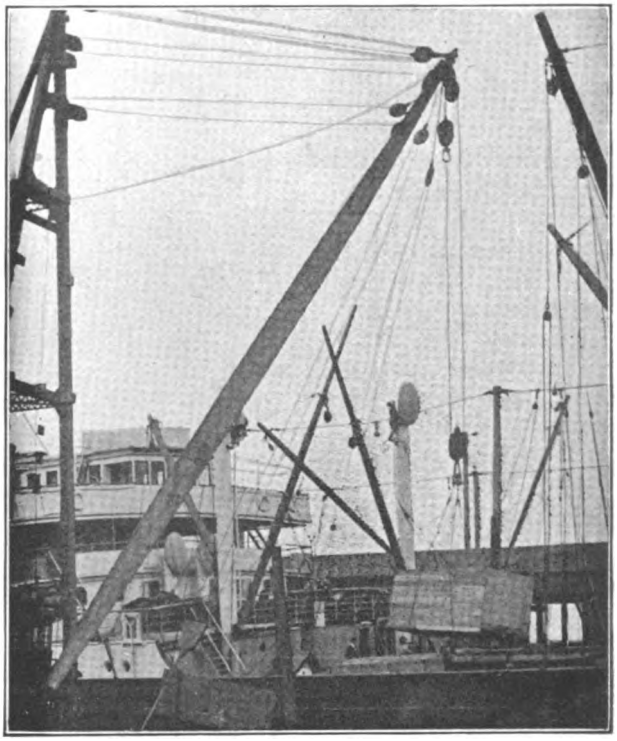
As its name indicates the triptyque is in three parts or sheets, the first of which is attached by the customs official at the point of entry, the second by the customs on the final exit, and the third, duly signed and stamped by the customs officers for entry and exit, is retained by the tourist. A separate triptyque is issued and used for each country entered. After the country has been crossed, the third sheet, signed and sealed, is returned by the tourist to the club, which then refunds the original deposit less a small fee which is retained for services rendered. As stated previously the forwarding company will arrange for the triptyques if the tourist belongs to either of the American organizations named.



There also is the international pass, which is recognized by the nations entering into the international agreement to pass automobile tourists for 10 days in any one country without complying with annoying customs delays at the frontier. America is not a party to this agreement, but it is understood that American tourists may secure the benefits of the international pass after establishing a temporary address in any of the countries which are a party thereto and securing membership in the foreign club.

One other point in connection with crossing the various frontiers should be mentioned. By securing a passavant at the time of leaving a country, it is possible to return at any time within a year without paying duty on the car or any of its accessories. The passavant contains a full description of the machine and everything on it and costs five francs ($1). It is desirable to secure this document, even though the tourist is supplied with a triptyque or international pass, as the customs laws of some of the foreign countries require duty even on goods made therein.

The American driver will not need a special operator's license in most of the countries visited, but every operator of a car in France must secure a special license. It is necessary to supply five small photographs of the chauffeur and three of the owner. The former should be about 1.25 by 1.625 inches and the latter two by three inches. These are attached to the various licenses for identification purposes. A plate also must be carried on the car giving the owner's name and address, both permanent and temporary.

While the forwarding company will look out for the insurance, if requested, it cannot be made too emphatic that insurance is extremely necessary, particularly in France. Another point to be remembered is that in case of accident the driver should remain upon the scene until the arrival of the police. The laws of France permit the collection of full damages in case the motorist leaves before the police have made investigation, no matter whether he was the aggressor or not.

Several minor details of the laws in the various countries differ from those in America, but full information can be secured of the forwarding company or from the foreign automobile organizations. It is well to add that after a stay of three months in France, the foreign resident becomes subject to a personal property tax on the car, which must be paid before leaving the country, else the car and owner will be held up at the border.

Handling the Crate from a Lighter, Showing the Height and Power of the Shear Legs.

For the convenience of those who desire to tour abroad, a table is presented herewith giving all the most important sailing dates for the season of 1913. These are subject to change without notice. The Automobile Journal is indebted to the Raymond & Whitcomb Company, New York City; Thos. Cook & Son, Boston, and the Church Ticket Agency, Providence, R. I., for the information therein.

SHORT TOURS AND CAMPING TRIPS.

How the United States Government Is Assisting Motorists to "See America First"---Suggestions with Reference to the Tent and Other Necessary Paraphernalia.

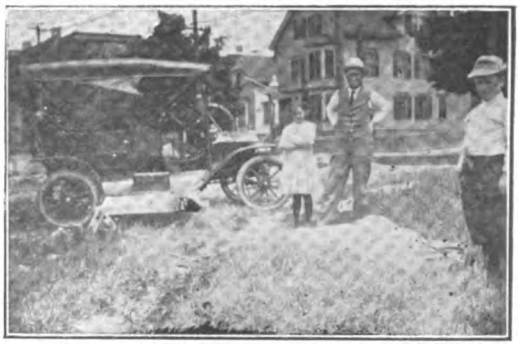
SO MUCH attention has been paid to long distance touring that the possibilities of shorter trips along the highways and byways of the country by motor car are sometimes overlooked. "Seeing America First" is too often taken to mean that the tourist shall visit distant points, and while a transcontinental journey or a trip to the mountains is desirable from every viewpoint, it is quite as essential to become familiar with the beauties of nature nearer home. The intimate knowledge thus obtained affords real pleasure, which is still further enhanced by the fact that the tourist is enabled to enjoy repeated vacations of longer or shorter duration throughout the season, another factor of decided moment.

Before the advent of the motor car many business men were accustomed to find their recreation in hunting or fishing trips. There is no reason why the two should not be combined. All that is essential is a camping outfit which shall be capable of being transported readily by automobile. Thus equipped the motorist may leave home at any time he wishes and return at will, the itinerary and schedule arranging themselves to accommodate circumstances. Stops may be made wherever fancy dictates, and may be extended as long as desired. The same thing applies with those who may not be fond of hunting or fishing, but to whom camp life makes an especial appeal.

The Compac Tent Installed with Henderson Car, the Particular Feature Being the Absence of Poles.

In this connection it may be pointed out that the United States Geological Survey, Department of the Interior, Washington, D. C., is issuing some particularly attractive maps which can be used to decided advantage in tours of this character. Since its organization, some years ago, this bureau has been engaged in making a topographic survey of the United States. The work is still far from being completed, but the maps now available cover a large portion of the country. These are sold at 10 cents each, or six cents in orders for 50 or more.

The key map covers an entire section, New England for example, from which it is possible to select the individual maps desired. These are arranged to show all main highways, intersecting roads, steam and electric railroads, etc. All ponds, brooks, rivers and bridges are indicated, as well as practically all dwellings and other important buildings in the country districts. A particularly desirable feature is the contour line, by means of which it is possible to determine whether the highway traverses hills, steep grades or gentle slopes. A few minutes' study of the maps should be sufficient to enable the motorist to become somewhat well acquainted before leaving home with the nature of the country through which he wishes to tour.



There is but one criticism to offer, this being based upon the fact that some of the sections were surveyed a number of years ago, and a growth of the country has made necessary the construction of new highways in places. As a result the maps are not strictly accurate in this regard, but if the tourist remembers that they are drawn exactly to scale he should have little difficulty in locating the road he desires, although it may appear that other highways exist than those presented. This fault is being remedied as fast as possible, supplemental surveys being made at frequent intervals whenever opportunity affords.

While it is possible to use any style of tent

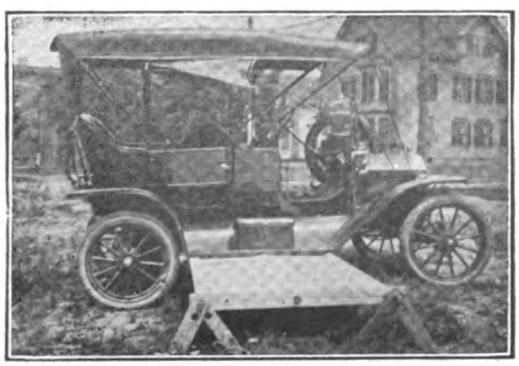
Tent Raised and Children Seated on the Couch or Bed.

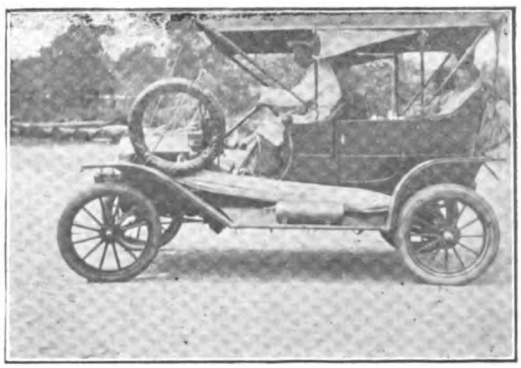
Tent Folded Ready for Packing, Also Showing the Couch.

that will permit of being packed in small space so as to be stowed away conveniently upon the car. there are several makes in the market which have been designed especially for just such tours as are indicated. One of these is illustrated herewith, the particular feature being the absence of poles. The tent itself is made in one piece, ventilation being accomplished by six windows covered with a gauze netting and protected against rain by canvas flaps. It is opened from both ends by doors that are fastened with button snaps, and a partition is provided so that the interior may be divided into two private rooms with separate entrances.



Special Tent Utilized with Ford Car on Recent Transcontinental Tour.

Other illustrations present in detail the equipment utilized by William L. Finley, Janesville, Wis., on a recent tour from that city to Boston and return. The car was a Ford and it will be noted that the tent and couch were so arranged that it was possible to fold them into small space for carrying on the car, the former in a bag at the rear and the latter in another bag on the running board.



Concerning the other equipment for a camping trip there practically is no limitation except with reference to the amount the tourist desires to expend. It might be contended that provisions could be carried in any convenient package and the occupants of the car could manage without extra garments. On the other hand, the market is well supplied with accessories which tend to equip the camping tourist for any emergency. Some of these are presented in accompanying sketches.

The list of trunks includes those which may be carried on the running board or at the rear, and those which serve a double purpose in that they may also be utilized as footrests. It will be noted that some of these make provision for women's hats, and this feature is also to be found in cases made to fit inside the tire trunk. The so-called wardrobe trunks afford opportunity for carrying two or three suit cases, and are arranged so as to operate much in the nature of a chest of drawers.

In providing for the "table," the choice is even

Accessories That Appeal to Motor Camping Parties: A, Luncheon Outfit in Suit Case Form; B, Pocket for Attachment to Interior of Car; C, Thermos Case; D, Portable Ice Chest; E, Utilizing Tire Trunk for Hats.

wider, including everything from the handy little hamper to the most elaborately fitted lunch carrier designed as a suit case, equipped with knives, forks, spoons, salt and pepper shakers, napkins, tablecloth, etc., a generous space for food and four short legs readily converting it into an outdoor table. Some are made of wicker work and others of kiln dried bass wood covered with heavy enameled duck.

The utility of the Thermos bottle, for carrying both hot and cold liquids, is well known. The handy case shown herewith is made by the Dover Stamping & Manufacturing Company, Cambridge, Mass., and provides for two of these vacuum bottles as well as a sandwich box. W. W. Winship, 71 Summer street, Boston, Mass., who makes a specialty of trunks and touring cases of all kinds, produces a similar carrier which is designed as a pocket to be attached to the interior of the car. Larger pockets, of leather or imitation leather, similar to that illustrated, are made for attachment to the back of the front seat, and are exceedingly handy for carrying extra clothing, etc.

Other illustrations serve to indicate the wide variety of carriers available. It is even possible to purchase a portable refrigerator in which there is a special compartment for ice, which should prove particularly attractive to the camping tourist. Many of these outfits are equally applicable to the long distance tour.

It is appropriate that the Turks, who sit much, have learned to build the most comfortable seat cushions. The Peerless Motor Car Company, Cleveland, O., maker of Peerless cars, has experimented with the Turkish cushion designs and this year Turkish upholstery will be used very extensively in Peerless machines, believing it to be best adapted for automobile use.

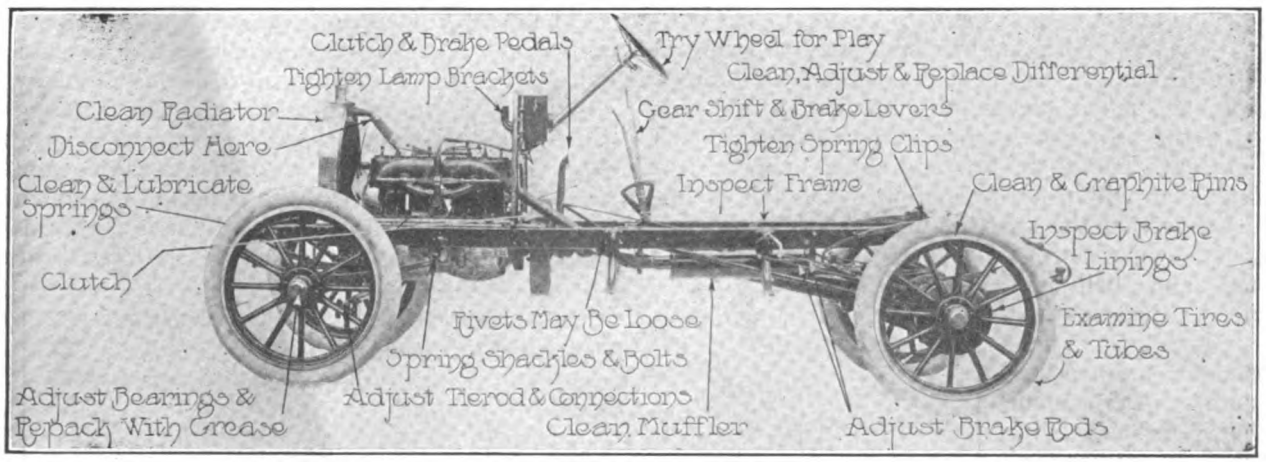
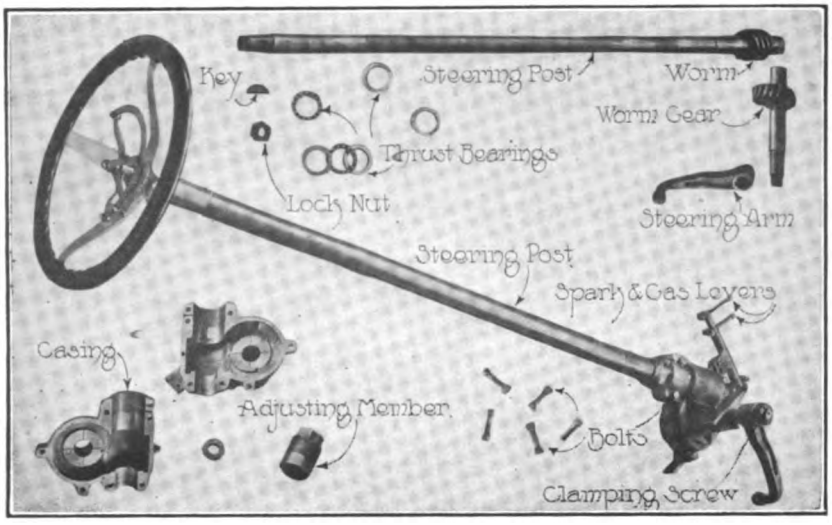
OVERHAULING THE CAR FOR THE TOUR.



Components Requiring Attention and Suggestions for Completing the Work---Brakes and Steering Mechanism Should Be Placed in Perfect Condition.

AS THE successful completion of a tour depends largely upon the vehicle, the owner should take every precaution to insure proper operation of each and every component. Nothing detracts so much from the pleasures of automobiling as to experience trouble on the road. Frequently the tourist meets with mishaps through lack of attention to small details previous to the trip, and invariably the trouble develops in the most undesirable locality and where the services of the expert repairman are not obtained easily. It is obvious that with the itinerary limited to a certain number of days any serious delay because of mechanical difficulties will mean a rearrangement of the schedule and possibly the elimination of some of the most attractive portions.

Motorists about to make their first tour, or those whose trips have been confined to good roads, fail to take into consideration the fact that in operating over hilly and strange roads the car is subjected to stresses not encountered where the driver is familiar with each hole and gully. Places of particular interest will tempt the tourist to leave the beaten paths and the highways may require considerable use of the low gear and the frequent application of the brakes. The same argument applies to other components of the chassis.



Many owners limit their tours, or in other words, plan a trip through territory where the roads are known to be good and free from steep grades, because of a lack of confidence in the capacity of their machine. This is a mistake, as a moderate priced car in good condition is as capable of giving satisfactory service as a high powered machine. This is substantiated by tours successfully completed throughout the country by light and moderately priced automobiles. It should be borne in mind that the fundamental principle of touring is to see the country, not how much of it can be covered in a given time.

The labor and expense involved in preparing the machine for the tour will depend on its age and condition. A new car may not need any attention other than grinding in the valves, removing carbon and a general inspection for loose nuts and bolts, etc. On the other hand, an old machine may require a complete overhaul and the replacement of worn parts. It should be remembered that the automobile which appears satisfactory to the owner may develop weaknesses when subjected to the severe service demanded of it in the mountains, etc. The inspection of all components should be very thorough and avoidance of makeshift repairs is recommended, for although such may have withstood ordinary service it is poor economy to patch up a part which undoubtedly will give trouble later. This applies particularly to the brakes and steering mechanism and the motorist cannot be too careful in overhauling and replacing any worn com-

Showing the Components Requiring Attention in the Overhaul of the Chassis in Preparing It for the Tour.

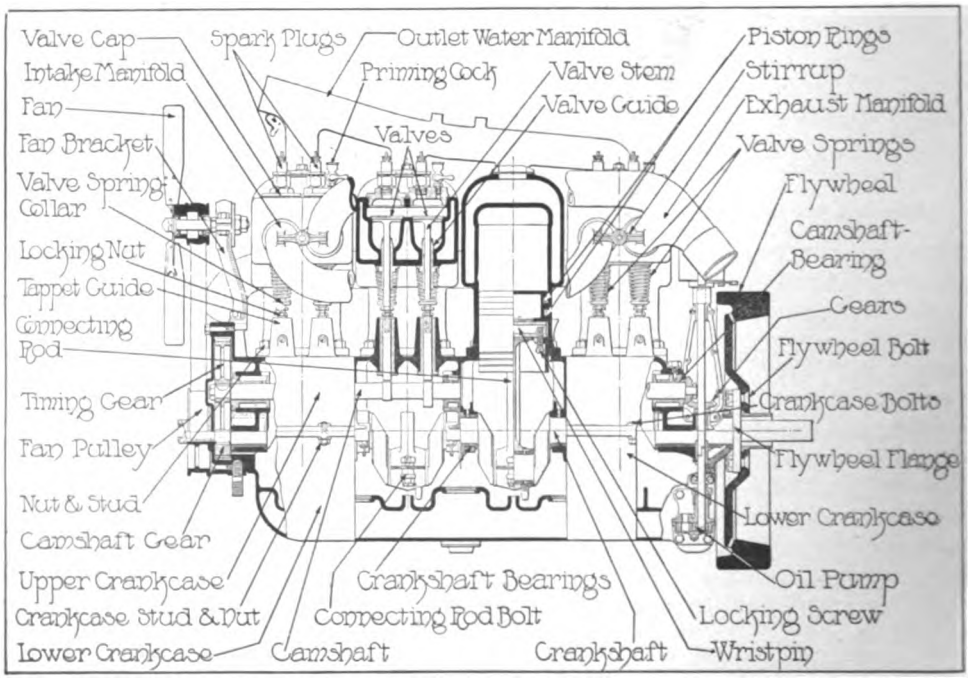
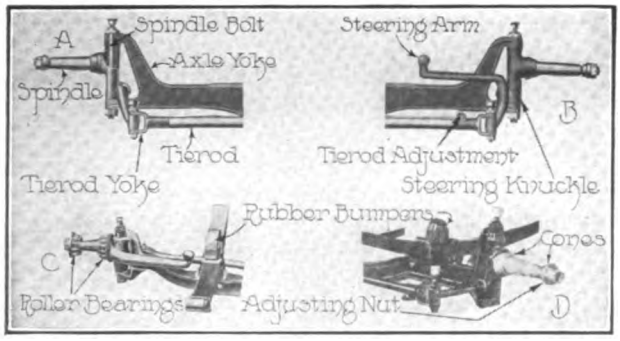
Illustrating a Typical Steering Gear and Its Parts—Lost Motion Is Eliminated by Meshing Unworn Part of Worm Gear with Worm.



ponents, as conditions may be encountered which will severely test the material and construction.

The motor should be placed in first class condition as its maximum efficiency may be required in negotiating long and steep grades which might not be climbed successfully on the second gear with the power plant not in proper shape. As continued use of the low and sometimes the second gear will test the cooling system, it is imperative that the radiator be thoroughly cleaned and the smallest of leaks repaired. Similarly, the fan and belt will need adjustment.

The bearings should be inspected and any loose members adjusted, taking care to replace all cotter pins. If the car has seen considerable service since its last overhaul it is a good plan to check up the timing of the valves after grinding them in and removing the carbon deposits. If the ignition system comprises a timer or a distributor, examine these members carefully and replace worn components with new or fit a new member. The magneto should be cleaned and oiled in accordance with the instructions of the maker, and as many manufacturers provide service stations the placing of the instrument in first class condition will not involve any great expense or loss of time. Clean the carburetor and fuel supply system, inspecting at the same time the float. The subjects of carburetion and ignition are discussed elsewhere in this issue, and suggestions are also made for correcting faults.



The type of clutch utilized will determine to a large extent the work of overhaul, as that employed with planetary transmission will require but little attention unless badly worn. The adjusting of the high speed member, low and reverse, is made easily where bands are employed.

The lining of the cone clutch should be examined and if it has been slipping and does not yield to the usual treatments it is best to fit a new leather. The multiple disc will require cleaning, which is accomplished easily by draining out the old oil and refilling with kerosene, engaging and disengaging the clutch several times, after which it should be refilled with the lubricant recommended by the maker. It is possible that the

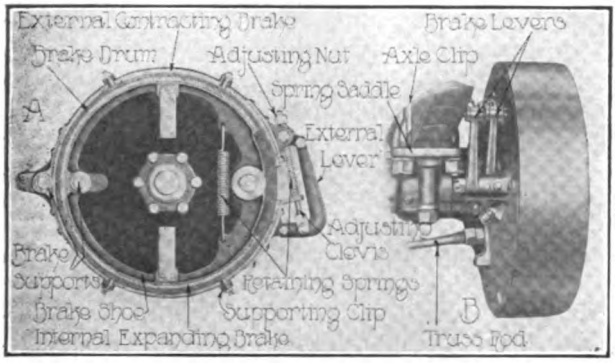
Digitized by Google

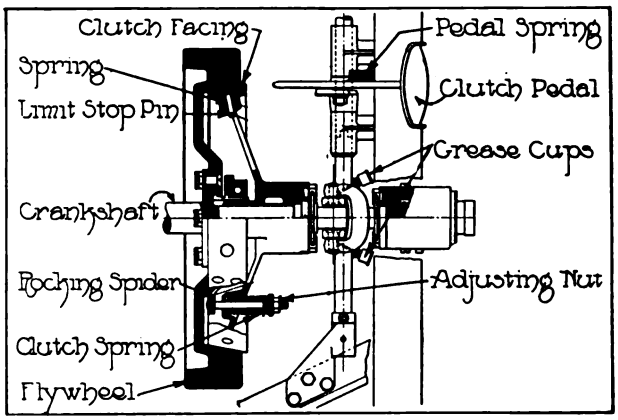


Front Axle Assembly and Parts Subject to Wear: A, Steering Knuckle Cut Away to Show Bolt; B, Adjusting Devices for Aligning Wheels; C, Conventional Types of Roller Bearings; D, Cones Utilized with Ball Bearing Wheels.

discs will require some slight adjustment.

Broadly speaking, there is not much to be done to the transmission if the gears and bearings are in good condition, other than remove the old lubricant and refill with new. If any of the gears are worn badly and do not mesh easily the trouble should be remedied. While on the transmission the shifting forks ought to be examined and adjusted if necessary, and the lever and quadrant gone over carefully to insure that the components are tight and do not stick or bind in their operation.

Universal joints are important and when these operate in grease packed in a boot, the latter should be taken off and cleaned. It will afford an opportunity to test the members for lost motion and the correction of same before renewing the grease and replacing the boot. The differential and drive shaft may not require any attention other than cleaning and the renewal of the lubricant, but it is possible that the position of the driving and driven gear may need correction and that the thrust bearings should be readjusted.



It is important that the rear wheels, axles and their bearings be in good condition as they are

The Brakes and Operating Mechanism Should Be Placed in First Class Condition.

subjected to severe stresses. As it will be necessary to remove the wheels to inspect the condition of the brake linings, it will provide an opportunity to examine the bearings, keyways, locking mechanism, etc. Ball bearings should be packed with a non-acid grease and care should be exercised in the adjustment so that the bearings do not bind. Loose wheel or axle bearings may be responsible for faulty operation of brakes or undue friction of these members.

Coming next to the subject of brakes too much emphasis cannot be laid upon the importance of having these members and their actuating mechanism in the very best of condition as their reliability will be severely tested on the tour. If the linings are worn, renew them. Clean and lubricate all parts subject to friction and test the rods and equalizers for binding. While on the subject of brakes it is well to point out that the springs may have lost their tension and may

Illustrating the Leather Faced Cone Clutch and Components Which May Require Attention.

cause the new lining to drag, burning the material, as well as decreasing the power of the car.

Torsion, radius and torque members are important factors in the drive of a machine and one cannot be too careful in giving these components the attention they deserve. If the rear axle be provided with a truss or strut rod, test these members for looseness and if play exists remove same. They should be set up snug, not too tight, the locking members being set up hard and cotter pinned. Before leaving the rear system search for loose rivets in the housing and make sure that all bolts and nuts are tight.

Springs, shackles, bolts and retainers should be gone over carefully and worn parts replaced with new. If the springs are dry or rusty, pry the leaves apart, remove the dirt and lubricate with graphite and oil. As many cars are equipped with shock absorbers these should be given the attention recommended by the maker. The

Digitized by Google

frame, cross members, aprons, fenders and their irons should be included in the inspection and the bolts securing these units tightened.

The most important component of the chassis is the steering mechanism, and the examination should be very thorough. Too much emphasis cannot be laid upon the necessity of disassembling the parts, inspecting each carefully and replacing any worn with new. The reach rod and its connections should be gone over, tested for play, and if not provided with means for adjustment, worn components should be rebushed or replaced with new. Tierod connections may be worn, creating considerable lost motion, which may also exist in spindles and pins. The bearings of the front wheel are next examined, readjusted and the lubricant renewed. In overhauling the steering gear the tube and base supporting the column should not be overlooked. All grease cups and the passages communicating to the bearings, etc., should be cleaned and the cups refilled.

No mention is made of the tires, tubes, etc., as the subject is dealt with elsewhere in this issue. The lamps and their brackets will require inspection, and cleaning if of the oil or acetylene type. It is needless to state that the gas tank should be exchanged for a new one if nearly exhausted. It will be an excellent idea to examine the top, curtains and windshield and to make any needed repairs.

As the majority of the cars are now fitted with electric lighting and motor starting systems, it is suggested that the battery be examined and the electrolyte tested in accordance with the instructions of the maker. As many motorists make it a practise to carry spare bulbs, the subject of lighting may be dismissed. Lack of space prevents the discussion of subjects pertinent to the preparation of the car for the tour, but it should not be taken for granted that because a machine has been overhauled it will not require attention on the trip. It is an excellent plan to go over the machine at the completion or beginning of each day's run, tightening any nut or bolt that may be loose and to examine the connections of the steering linkage. These precautions will prevent annoying delays and probable expense, adding considerably to the pleasures of the journey.

Among the recent automobile deliveries in Washington, D. C., were two Studebaker machines, both of 35 horsepower, one being a limousine to Senator Joseph W. Dixon of Montana, and the other a touring car to Representative C. B. Miller of Minnesota.

TO LECTURE ON ADVERTISING.

Harry Tipper of the Texas Company to Conduct Course at New York University.

His many friends in the industry will be glad to learn that Harry Tipper, advertising manager of the Texas Company, New York City, maker of Texaco lubricants, is to conduct a course on "Advertising" at the school of commerce, accounts and finance, New York University. Mr. Tipper is well qualified for this work, having a wide knowledge of his subject. Previous to his present connection he was president of the Technical Publicity Association and he is a member of the National Advertising Managers, Associated Ad-Clubs and the Advertising Men's League of New York. Mr. Tipper's course will present the fundamental principles of the science of advertising, and show its relation to business as a whole and to the several departments of the business. There will be about 30 class sessions of approximately two hours each, taking up the following topics:

Advertising and its relation to business—Advertising as a direct selling force; advertising as a distribution factor; the functions of the advertising department; the functions, growth, etc., of advertising agents; the place of the publisher; the relation of manufacturer's advertising department, agency and publisher to each other, and the economic consideration of advertising.

The medium in relation to the audience—Newspapers, field, service, local prestige, value, etc.; other news mediums, weekly papers, farm papers, etc.; magazines, a medium of entertaining, educational character; trade and class journals; direct mail; outdoor advertising; booklets and printed matter, and special advertising.

What to say to the audience—The general principles and the arguments to be used, the class of audience to be reached, etc.; the preparation of booklets, circulars and folders; the arrangement, dummies, etc., and samples, window displays and demonstrations, preparation and use.

The planning of an advertising campaign—The preliminary investigation, consideration of the extent, method and character of distribution, consumption, districts to be covered, character of article, etc.; the relation of all these factors to the choice of mediums and method; the arrangement of mediums; the product and the planning of copy in its relation to the campaign; the arrangement of the work and its relation to the campaign and the administration.

The Haynes Automobile Company, Kokomo, Ind., maker of Haynes cars, has let the largest contract for automobile bodies in the history of the company, being divided between the Glascock Bros. Manufacturing Company, Muncie, Ind.; Union City Body Works, Union City, Ind., and Portland Body Works of Portland, Ind. Other firms represented in the bids were: Laporte Carriage Company, Laporte, Ind.; Racine Manufacturing Company, Racine, Wis.; Central Manufacturing Company, Connersville, Ind.; Detroit Body Company, Detroit, Mich.; Carriage-Woodstock Company, Owensboro, Ky., and Capitol Body Company, Indianapolis, Ind.

TOURING GARMENTS FOR MOTORING WOMEN.

Influence of the Automobile Is Strongly Reflected in the Season's Offerings---Designers Have Prepared Wide Selection of Practical Models.

SINCE the automobile has taken such a prominent place in the social and business life of the world, the attention of the designer has been directed more and more toward the production of garments that are suitable for the woman motorist. The situation began to make itself felt in a decided manner a year ago, and with the opening of the present season it was soon evident that even with coats designed primarily for street wear there was to be a very definite suggestion of the car. This results in an extremely wide selection of charming and practical offerings from which the woman tourist may make choice.

It is not to be denied that for those who have no reason to consider difference in cost the exclusive creations by women's tailers and modistes will make the strongest appeal, and with such garments individuality is the prevailing note, but there are many who must regard expense where there are few who do not. And while it is desirable to possess a coat which lends a certain prestige to the wearer, there is no questioning the statement that the exclusive design may not be any more practicable or serviceable than one which can be secured ready made in any of the leading local shops.

Front and Back Views of Imported Model in Basket Weave Material with Boucle Effect.

The real secret of good dressing lies in selecting a becoming garment and in always having the proper clothes for the occasion. Now that motoring has become so intimately connected with a woman's everyday life, the latter portion of this problem is by no means so difficult as formerly. Obviously, there are certain coats and hats which are not to be considered as practical for motoring wear, particularly for touring, but it is a much easier matter to find suitable apparel when the line of demarcation between street and automobile is more carefully drawn.

The so-called Bulgarian models are held to be well adapted to motoring, although possibly the colors are not quite so pronounced as for street wear. Short coats are worn very extensively, but for long tours it is suggested that the longer models are somewhat more practical. However, it is by no means necessary to confine the decision to these two, coats of almost any length being shown.

The long coats that are used for motoring have some belt or suggestion of a belt. The cut-in effects are employed very largely and it is noticeable that the bottom of the skirt is made to conform to the lines of the straight models now so much in favor. The line that extends front and back from the collar into the high waist line gives the raglan sleeve expression, without its being really a raglan sleeve. This seam has a double row of stitching to outline it, and a belt effect all the way around, and is stitched in rows, the back and front having a smart touch of embroidery trimming. With some the buttons and buttonholes are small and the buttons are set close together. With many the front is straight in line.

The so-called travelling coat is made full length and may have the sleeves set in raglan style, over the kimono shoulder. The sleeves are long and have large cuffs, which look as if they might be turned up or down. Many are made to correspond with the collar. The fronts are cut straight down, as a general thing, although others are made to fasten at one side with loops of the material. Ball buttons are preferred in this in-

Digitized by Google

At Left, New Sport Coat in 40-Inch Length; at Right, English Auto-Coat, an Imported Design.

stance. The collars are made so that they can lie flat or be turned up around the neck. A noticeable point in these travelling coats is the oddness of the cut. It may be cut across the hip line and have big pockets set on a line and a yoke across the back. The main idea in this instance is to suggest fullness and comfort. The fullness, however, is caught in with straps having two buttons, one on each side, to fasten. Some of these long coats are double-breasted. Long revers prevail and the "made" buttonhole is holding its own, both for utility and trimming.

Then there are the coat wraps, all of which evince the kimono shoulder and sleeve with the fullness in the centre back held in at the hip line with a band of self, or a draping of the material, or the material may be draped in and held with a button. All of the newest ideas embodied in coats or wraps of this order have trimming of some kind, velvet being used in many instances.

Coats also are shown in the shorter lengths with braid trimming around the waist line, giving the expression of a high waist line. Large buttons and buttonholes are used. The collars are low and some are square across the back with a notched expression in front, and the revers are not large. This type of coat is semi-fitting in the back and straight in front; that is, the waist line is straight and at the hip line it is made quite tight. The collar is the principal feature of this type, and one might say that it is so cut that it can be worn as a most attractive high collar, though it looks equally well when low. Buttons also are a feature with this coat.

Various types of sport coats are shown in numerous materials. These are made with box pleats extending all the way to the bottom. A belt is set on at the hip line through narrow loops of the material, and there are five buttons and made buttonholes. There is a notched collar and revers, and the sleeves are straight. Other sport coats are made with the fullness caught in with a deep belt and are stitched top and bottom. No pockets appear in this particular type of garment. Still another model is shown with four pockets, two breast and two side, while a belt encircles the waist above the hip line.

Many tones are used in the materials, especially in the mixtures. Among the materials mentioned are mohair, polo cloth, zibeline, rajah linen, cloth of gold, suede, tweed, eponge, boucle, etc.

A number of the season's models are shown herewith, the illustrations being from photographs secured through the courtesy of Cherry & Webb, Providence, R. I. The first of these, presented both in front and back views, is an imported design, made of basket weave material with the boucle effect. It has the convertible collar, which may be worn buttoned closely about the neck as shown, or open at the throat. It also has the raglan shoulder effect, giving ample room over suits and dresses. The shoulders are lined to the hip line with Skinner satin. The trimming

At Left, Black and White Striped Zibeline Model; at Right, Black and White Checked Mohair.

Digitized by Google

includes large handsome bone buttons, and a band under the sleeves extends down across the back. The model also presents the extra wide cuffs. The hat with this model is of French gray felt, with grosgrain trimming and ribbon binding on the band and side.

Another imported model is the English autocoat, made of tweed, this being presented in the 48-inch length. Among the features noted are the extreme fullness around the skirt, in which it differs somewhat from the other designs shown. It has the loose raglan sleeves and large pockets, making for decided comfort. The buttons are of crushed leather, the whole being made in one piece. The hat in this instance is of Austrian velour, trimmed with ribbon.

One of the new sport coats is shown in the 40-inch length, this being furnished either in boucle, chinchilla, eponge or the ever popular black and white checked goods. The large patch pockets are trimmed with the same ivory white buttons as are used at the front, but the belt is held in place at the back with buttons of the same material as the coat itself. While it is possible to wear the collar open at the throat, it is designed to be worn as shown, and is faced with ratine. The sleeves and yoke are lined with peau de cygne. With this model is shown a large panama hat with wide brim, trimmed with ostrich pompon and a band of ribbon matching the shade of the coat.

A shorter coat still is the Newport model, shown in the 36-inch length. This comes in cut velour and chinchilla, and has the new long roll lapel, cut in to button high at the neck when desired. The buttons are large and of the same material as the coat. Two breast pockets, deep cuffs and a loose box back are among the distinguishing features. The lining is of peau de cygne, the same color as the coat. With this model it is suggested that the plain panama hat is quite becoming.

For a long tour it is anticipated that nothing will make quite the same appeal as a linen coat with motoring cap of the same material. The model shown is of linen crash, but it may be stated that this style also comes in the mohairs. The buttons in this instance are of brass, and practically the only relief from the severity of the design is to be found in the belted back and in the mannish sleeves, although this latter might be held to add to rather than detract from the simple lines of the model. The cap is tied at the throat with ribbons of the same material.

Another model illustrated is of black and white striped zibeline, trimmed with cerise velvet collar and cuffs, these being faced with white broadcloth. It is designed to be worn either open or closed at the throat. Still another row of the small round white buttons is to be found at the back. The coat has the popular deep set-in sleeves, and is lined throughout with cerise peau de cygne. The hat is an imported English model, of rajah silk, with stitched brim and band and carrying a fancy feather at the side.

The last model shown is of black and white mohair, trimmed with large fancy bone buttons and velvet collar piped with broadcloth. The side belts define the waist line, while the design is worked out to give a double-breasted effect. As will be noted, it is possible to button the collar closely about the neck when desired. The hat is a panama, poke shaped, trimmed with cherries and ribbon.

At Left, Linen Duster and Motoring Cap; at Right, the 36-Inch Newport Model.

The Goodyear Tire & Rubber Company, Akron, O., announces its new Goodyear tire branch and truck service station will be opened at the corner of Jackson avenue and Honeywell streets, Long Island City, N. Y., in about six weeks. It is to be four stories high, 275 feet long and 50 wide. There is to be a showroom, warehouse and a wheel shop, the last named affording opportunity for tire applying and wheel work at all hours. The warehouse will be large enough to carry all the tires necessary to keep this territory well supplied.

CARBURETION TROUBLES AND THEIR REMEDY.

Presenting Standard Types of Vaporizers and Directions for Cleaning and Adjusting--Effect of High Altitudes and Hints for Obtaining Efficiency.

EVERY motorist who drives his own car should have at least a working knowledge of the carburetor fitted to his motor. These instruments are not complicated and it is an easy matter to become familiar with those components that may require attention during the tour. It is possible that dirty fuel will clog the spraying nozzle or filters, and that in operating in high altitudes the mixture will need to be changed. It is a well known fact that when driving in the mountains considerable trouble is experienced in carburetion due to the reduced atmospheric pressure. This is overcome by changing the adjustments and if the owner be familiar with the type of vaporizer fitted to his car, it will be a simple matter to correct faults due to changes of this character. Views of standard makes of carburetors are presented herein with their components lettered, which will prove of service in making adjustments or cleaning.

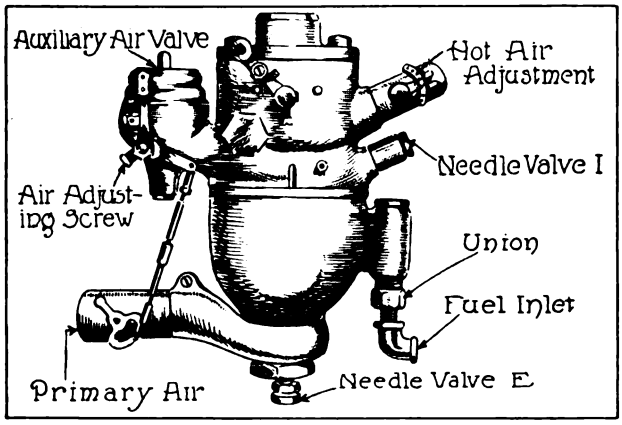

Fig. 1—Illustrating Components Employed in Making the Low and High Speed Adjustments of Model O Schebler Carburetor.

Stromberg.

Stromberg carburetors are produced in five types, A, B, C, D and G, respectively, A and B having single jets, while the others have both a primary and an auxiliary nozzle. The Stromberg is not a difficult carburetor to set, as there are but two adjustments to be made, a low and a high speed, these components being shown at A and B respectively in the sectional view of the type A vaporizer at Fig. 4. As the adjustment of other types is similar a description of A will serve all practical purposes.

As it is possible that climatic changes may compel a slight alteration of the original setting, it is well to have a knowledge of the work involved. It should be remembered that the low and high speed members are adjusted separately. The proper low speed mixture is obtained by turning the nut A up or down until the low speed spring f seats the valve e lightly. By this is meant that the tension is sufficient to retain the valve on its seat. It is important that the high speed spring e should have about .06125 inch play. By rotating the nut A up or down, and by turning it one notch at a time, the desired, even idle, operation of the motor is secured. This is obtained with the spark retarded and throttle but slightly open. After the motor has become warm, retard the throttle and note if it runs as slowly as desired. If not, move out the screw acting as a stop for the lever. To increase the speed move in the screw.

To adjust the high speed, advance the spark and open the throttle, and if the motor backfires or shows an indication of a weak mixture, turn up the nut B a notch at a time. If too rich, rotate the nut in the opposite direction. It is important that the high speed spring g should have at least .03125 inch play when the motor is idling. The season adjustment is shown at t and this should be open in warm weather.

The height of the float and proper size nozzle is provided at the factory and should not require any attention. If it becomes necessary to displace the nozzle it is accessible by taking off the nut u, after which the nozzle c can be removed with a screw driver. The float chamber may be drained by opening the petcock p. Should this fail to remove obstructions in the fuel line above the inlet pipe, take off the nut c c and clean the filter n.

Too much air is usually denoted by the motor being hard to start and by its speeding up upon closing the air valve; by the engine being slow to respond when opening the throttle, and by back firing. A lack of fuel presents similar symptoms. Too much fuel and not enough air is known by the motor speeding up when the air valve is opened slightly; by missing when the car is being operated slowly on the level and by failing to pick up when the clutch is disengaged. The last named condition indicates a very rich mixture.

Schebler.

Although Schebler carburetors are made in several types, models F, L and O may be said to be the most popular. Models O and L are shown at Figs. 1 and 2 respectively with their components lettered. Models F and L have single jets, although provision is made for adjustment of the high, intermediate and low speeds, and both are fitted with the lift type of needle, this member providing more fuel and proportionately to the speed of the motor.

To set the model L carburetor the low speed needle valve, Fig. 2, is screwed in until it seats firmly. Next unscrew it about a turn and a half, and prime or flood the carburetor. Open the throttle slightly less than two-

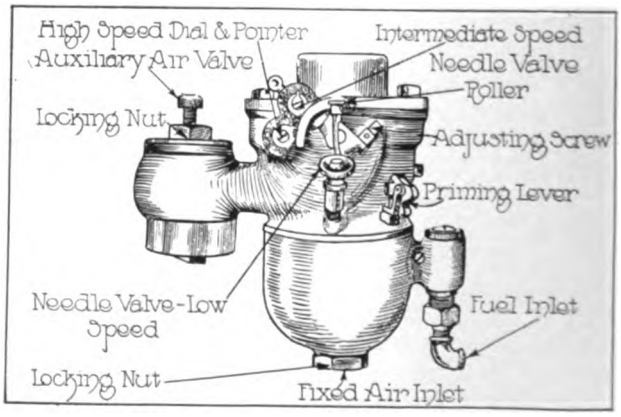

Fig. 2—The Intermediate and High Speeds Are Obtained with the Schebler L Type of Carburetor by Moving Arms on Dials.

Digitized by Google

thirds way, and with the spark retarded start the motor. Change position of low speed needle until the engine runs smoothly. If it operates too fast, move out the adjusting screw, which restricts the opening of the butterfly valve. If the motor stalls, move the screw in.

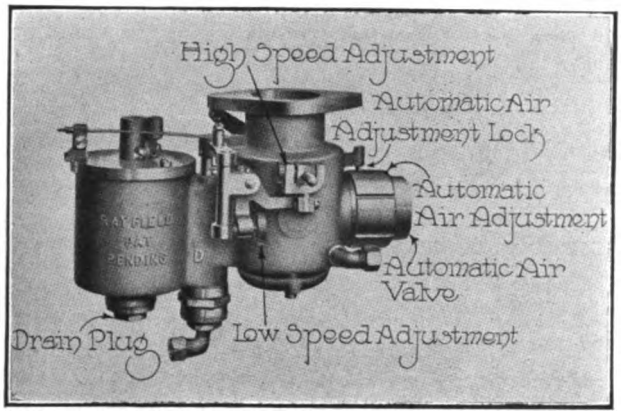

Fig. 3—The Rayfield Carburetor Has Two Fuel Adjustments in Addition to an Automatic Air Valve Member.

The low speed member must not be disturbed in making the adjustment of the intermediate or high speeds. These are obtained by moving the arms or pointers on the dials, of which there are two. The intermediate is adjusted first and has three numbers, 1, 2, 3. Move the arm or pointer from the figure 1 toward the figure 3, about half-way between these members. Next advance the spark and open the throttle so that the roller moving on the track like member beneath the dials is in line with the intermediate speed dial. It is important that the auxiliary air valve seat lightly.

If the motor backfires with the spark and throttle lever in this positon, increase the amount of fuel by moving the arm toward the figure 3, or if the mixture be too rich, back toward the figure 1. A little experimentation will secure the proper position. Noting the color of the exhaust and its odor also will be of value. The high speed is secured by utilizing the other dial and pointer, and with the throttle wide open. The maker of the Schebler recommends cutting down the supply of fuel until the motor shows signs of backfiring, then increasing the amount until the engine runs evenly and smoothly. Turn the low speed member a notch at a time and note the results. In adjusting the arms, do not move these more than half way at a time between the graduated divisions or marks. Slight variations may be necessary in setting the speeds as, frequently, apparently proper operation with the motor idle will not obtain the desired results under load.

Model F.

The model F is similar to L, differing in that but one dial is provided. The low speed is set in the same manner, but with the intermediate the spark is advanced about one-quarter and with the throttle one-third open. In this position cutting down the fuel by screwing in the needle or slow speed member should not result in speeding up the motor. This indicates that the point of the needle is too large. The engine should run smoothly and will if the needle is of the proper size. As previously pointed out, the proper needle is inserted at the factory and the above suggestion is made for the benefit of those who fit new carburetors. The adjustment for high speed is secured by advancing the spark one-quarter and with the throttle open to its maximum. The arm or pointer should stand at the figure 1 on the dial. If the motor backfires, it indicates that more fuel is required and this is obtained by moving the arm toward the figure 3. If the backfiring continues and with the arm at 2, increase the tension of the spring of the auxiliary air valve; that is, cut down the air supply.

Model O.

The model O Schebler is provided with two jets, these being shown at Fig. 1 by the letters I and E respectively. In adjusting this type the auxiliary air valve is seated lightly and the needle members I and E screwed in until seated firmly. Do not use pressure. Next turn valve E to the left about three turns, open throttle about one-third and start the motor. After the engine is warm, turn valve E to the right until the motor operates smoothly and slowly with the throttle nearly closed. Open the throttle slowly until about one-third open and if the motor backfires screw in the adjusting screw until the motor runs evenly. Next open the throttle wide, and if the motor backfires at speed, turn needle member I to the left until the missing ceases. The second jet is not utilized until the car attains a speed of from 18 to 25 miles an hour, or a motor speed of from 700 to 1000 revolutions a minute. The needle or jet I is not difficult to adjust and when set for high speed exposes from one to four threads of the knurl.

To clean the Schebler models described the nut retaining the bowl or float chamber is removed, although sediment in the spraying nozzles can sometimes be displaced by cranking with the primary air passages closed. This exerts considerable suction, which will invariably remove small particles.

Rayfield.

The adjustment of Rayfield carburetors, models D and H, is similar. At Fig. 3 is illustrated an exterior view of the water jacketed type with the components utilized in adjusting clearly lettered. The low speed is set first by turning the low speed screw to the left until the arm member above it and slightly to the right just breaks contact with the cam above that. Next turn low speed screw 1.5 turns to the right, open the throttle about one-quarter, prime the carburetor and start the motor. Close the throttle until the motor runs slowly without stopping, then turn the low speed screw to the left, cutting down the fuel, and do this one notch at a time until the engine idles smoothly. The desired speed may be obtained by the adjustment of the screw in the top arm to the left, using a screw driver.

Open the throttle slowly until wide open. If the motor backfires turn the high speed adjusting screw to the right, a half turn at a time, until each cylinder fires evenly. Should the motor not backfire, turn the high speed screw to the left until it does, then to the right until it runs smoothly. This insures economy of fuel and efficiency as well.

One is apt in setting the Rayfield for the first time to obtain too lean a mixture, which makes it sensitive to climatic changes. The low speed should not be touched in setting the high, but should the motor backfire with the throttle about one-quarter open, the automatic air adjustment should be turned to the right a turn or two, increasing the tension of the spring and decreasing the

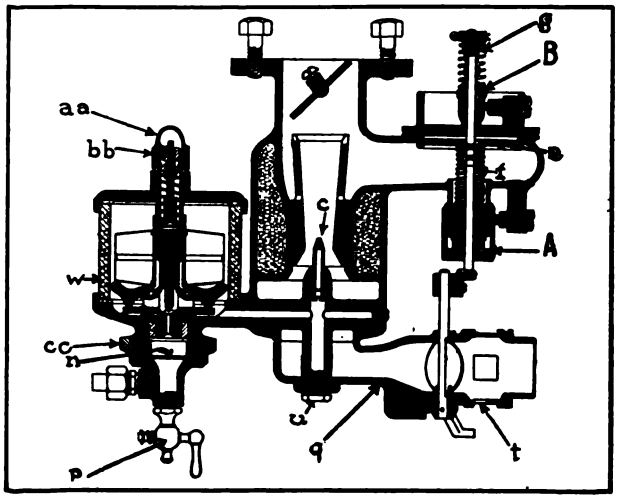

Fig. 4—Adjustment of the Stromberg Carburetor Is by Nuts A and B, the Former Being Used for the Low and the Latter for the High.

amount of air slightly. For very high altitudes the maker recommends setting the air valve so that it seats a trifle lighter and cutting down slightly on the low and high speed fuel adjustments. It should be remembered that the automatic air valve must be seated when the motor

Digitized by Google

is idling. It is further suggested that starting is made easier when the throttle is about one-quarter open. The float chamber is drained by removing the plug member.

Planhard.

The simplicity of the Planhard carburetor will appeal to motorists who take care of their cars, as not only is

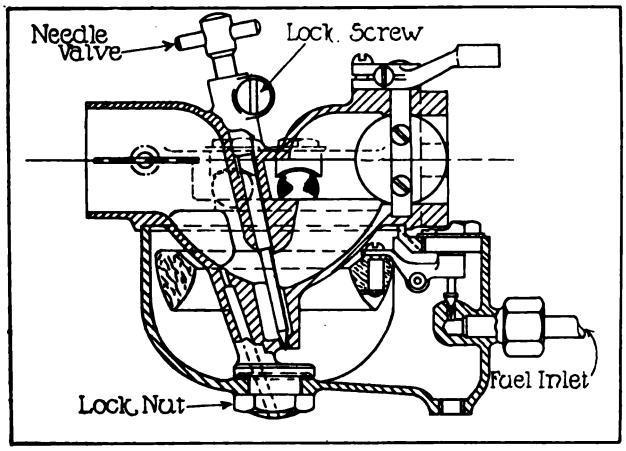

Fig. 5—The Kingston Has But One Adjustment, That of the Fuel.

the vaporizer easily adjusted, but it may be disassembled and assembled without interfering with its efficiency. Fig. 6 illustrates the components of the Planhard and it will be noted that there is but one part requiring attention in setting the vaporizer—the needle valve member. Its position is retained by a lock screw, by unloosening which the needle may be raised or lowered, increasing or decreasing the fuel supply. All air taken into the carburetor is compensated for automatically, a number of balls being raised from their seats, these being lifted progressively. It will also be noted that the construction of the float chamber is such that it is difficult for sediment in the fuel to reach the spraying nozzle and that the displacing of the lock nut enables rapid and easy cleaning of the carburetor. The maker holds that the Planhard will adjust itself to the varying climatic changes.

Kingston.

A sectional view of the Kingston carburetor is shown at Fig. 5 and there is but one part to be adjusted, the needle valve. This is locked by a screw which should be loosened when any change in the adjustment is attempted. To set the carburetor, unloosen the lock screw and turn the needle valve to the right until entirely closed, then in the opposite direction a full turn. With the motor operating, retard the spark during the following operations: First, turn the needle valve slowly to the right until the motor backfires through the carburetor, noting the position of the needle valve. Second, turn the needle valve slowly to the left until the motor attains its maximum speed, after which tighten the locking screw. It is held that the auxiliary air controlled by the floating ball valves will take care of the mixture for speeds above or below this point. The carburetor is disassembled for cleaning purposes by displacing the lock nut shown.

Effect of High Altitudes.

Mention has been made of the effect of climatic changes upon the mixture and the need of slightly altering the adjustments, the method depending on the type of carburetor, etc. In high altitudes the reduced atmospheric pressure, 5000 feet and over above sea level for example, is such that the proper proportion of air is not provided. There are two methods of compensating for the lack of air, one by increasing slightly the member admitting air, and the other by cutting down the supply of fuel. The loss of power noted when travelling in the mountains is due to the reduced atmospheric pressure, which impairs the efficiency of the engine. Consequently the combustion may be said not to be as rapid or as complete as under normal conditions.

The maker of the modern carburetor has provided for this contingency by fitting his product with devices for controlling the air or mixture, and in some instances both, from the seat. This is a decided advantage over the earlier forms of carburetors as the effect of altering the mixture may be determined with the motor under load and without stopping to lift the hood.

Heating and Flooding.

While there are a number of conditions which are responsible for boiling of the water in the radiator and heating of the motor, these symptoms may be noted in high altitudes and be due entirely to the mixture. Either too weak or too rich a mixture will cause heating, and is largely responsible for boiling of the water.

The most general cause of flooding is dirt lodging under the fuel valve. This member controls the flow of the gasoline passing into the float chamber and operates automatically in that it maintains the level of the liquid. When the height of the fuel attains a predetermined level, the valve closes. When flooding is due to sediment it can often be cured by priming or flushing and draining the contents of the float chamber.

Backfiring.

Attention has been called to backfiring in the adjustment of several types of carburetors and in each instance it has been stated to be due to too much air or not enough fuel. The direct cause of backfiring through the carburetor is the ignition of the mixture in the intake pipe, the gases being fired by a flame remaining in the cylinder after the inlet valve opens. Too late a spark and open throttle will sometimes cause backfiring. Dirt or sediment clogging the spraying nozzle will create similar symptoms, preventing starting of the motor, or if the engine does respond, operating irregularly and finally stopping. The dirt can usually be removed by opening the needle valve a turn or two while the motor is running. It is also an excellent idea to open the petcock and remove a cupful or so of fuel. Sometimes when the engine fails to respond because of dirt in the spraying nozzle, priming the cylinders will be found beneficial as the initial explosions will exert the desired suction on the spraying nozzle. The float chamber should be drained afterward and only when the motor is inoperative.

Straining the Fuel.

Too much emphasis cannot be laid upon the importance of thoroughly straining the fuel. Do not allow any garage attendant in replenishing the supply to use a funnel that is not equipped with a suitable strainer. The best is a chamois, as some wire strainers have too coarse a mesh or screen and allow small particles of dirt to be carried with the liquid. It is much better to take a little more time to see that the gasoline is filtered properly than to be delayed on the road cleaning a carburetor. It is also an excellent practise to open the filter occasionally, as well as the petcock of the carburetor. These simple precautions should be observed.

As carburetor troubles and ignition disorders are closely allied it is important that one should satisfy

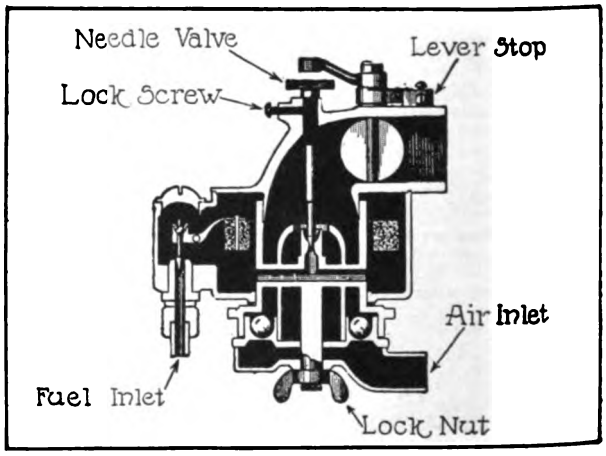

Fig. 6—Sectional View of Planhard, Noticeable for Simplicity of Adjustment and Ease of Disassembly for Cleaning, Etc.

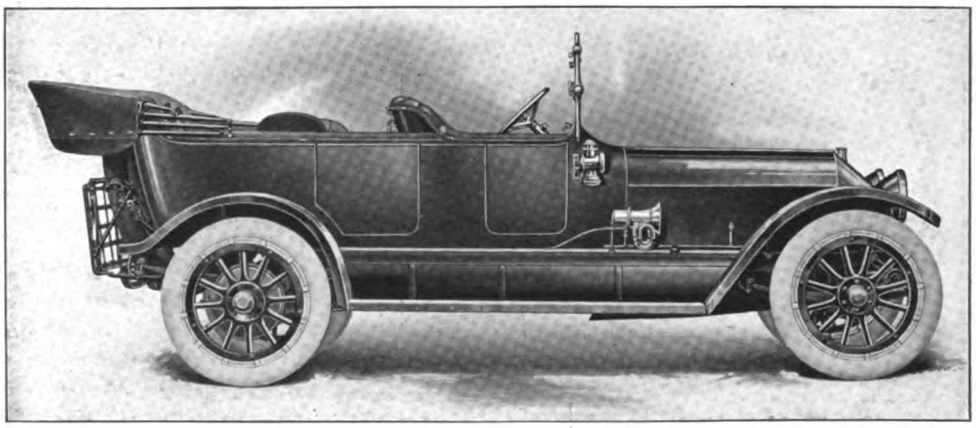

himself that the difficulty is due to the vaporizer before altering its adjustments. As some garage attendants frequently assume that the carburetor is to blame without first locating the source of trouble, the motorist is advised to be convinced before allowing what might prove an unnecessary bill of expense to be incurred.

KNOX ANNOUNCES NEW TYPE OF BODY.

THE Knox Automobile Company, Springfield, Mass., one of the oldest manufacturers of motor cars, announces that its line for 1914 will include, in addition to the body types already offered for the present season, the Prince Henry or stream line design, shown in an accompanying illustration. It will be constructed in four, six and seven-passenger capacities for the Knox Little Six chassis, which will be continued, it having been demonstrated to the satisfaction of the company that it meets every requirement of service. The efforts of the concern in recent years has been concentrated upon the refinement of chassis details, a study of improved body designs, and a careful process of selection and elimination to secure the equipment necessary to the comfort and convenience of the purchaser. The bodies fitted to the 1913 chassis will be retained, these including a six and seven-passenger torpedo, two, three and four-passenger raceabout, seven-passenger limousine and seven-passenger landaulet. A wide variety of finish also is offered.

The six-cylinder motor of the Little Six is cast in pairs with detachable cylinder heads and with valves in the head. The bore is 4.375 inches and the stroke 5.5, developing approximately 46 horsepower according to the S. A. E. formula, The transmission is the Knox selective type, three speeds forward and reverse, having imported annular ball bearings and all gears and shafts of a high grade alloy steel. The clutch is the Knox three-plate with cork inserts and the drive is by a straight line shaft. Two separate and distinct ignition systems are provided by a Bosch magneto and a distributor with battery. The well known Knox oiling system is continued. The Knox full floating rear axle is fitted to all models and both sets of brakes, which act directly on the rear wheels, are liberal in size. The upholstery of the new body is in keeping with the high grade maintained by the company. The fuel capacity is 24 gallons, wheelbase 134 inches, tire sizes 38 by five, with demountable rims. Electric starting and lighting will be standard equipment on all 1914 models.

New Prince Henry or Stream Line Type of Body Which Will Be Fitted to 1914 Knox Little Six Chassis in Four, Five and Seven-Passenger Capacities.

RACE FOR ANCIENT CARS.

California Owner of 1904 Marion Would Compete with Contemporaneous Products.

E. L. Symonds of the Symonds Motor Car Company, Los Angeles, Cal., has issued a sweeping challenge to race a 1904 air-cooled, double-chain drive Marion, made by the Marion Motor Car Company, Indianapolis, Ind., against any machine in Los Angeles built during that season or prior to that time. Mr. Symonds says the race is open to all and that the distance may be anything up to 100 miles for any purse the other contestants may desire. Provided that it is at least nine years old, no car will be barred because of age, color or previous condition of servitude.

While Mr. Symonds is reticent concerning the speed of his ancient car, experts who have examined it are confident that with proper tuning it will do at least 30 miles an hour and possibly five miles an hour better than this. The machine formerly belonged to C. P. Dodge of Los Angeles, and he estimates that he has driven it upward of 200,000 miles.

In the event that Mr. Symonds' challenge is accepted it is anticipated that the contest will be followed with decided interest.

CORRESPONDENCE WITH THE READER.

Adjusting Pressure Feed.

(1608)—Am experiencing trouble with the fuel system of my machine which is of the pressure type. I am unable to get the gauge to register over 1.5 pounds and unless the motor is driven at a good rate of speed the pressure falls considerably. I have been all over the connections and tested for leaks, but none appears to exist. The result is that I have trouble when climbing hills, etc., owing to not enough gas in the float chamber of the carburetor. Any suggestions will be appreciated.

READER.

Independence, Kan., June 25.

As make of car was not mentioned other than general suggestions cannot be made. There are two methods of obtaining pressure, one by utilizing the energy of the exhaust gases, and the other by a positively driven pump. With the former system, a pipe is led from the exhaust line, usually the manifold, to the fuel tank. A check valve is also employed to allow the gases to pass to but not from the container. Frequently these check valves become carbonized, and not seating properly, allow part of the pressure to escape.

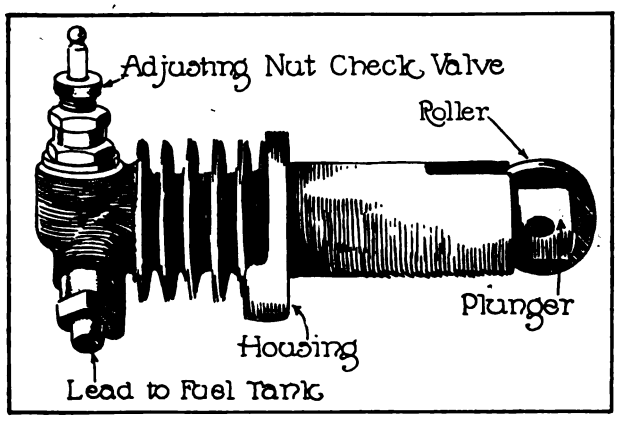

Fig. 1—Showing the Components and Adjusting Device of Pump Utilized in Pressure Feed Fuel Systems.

This is more particularly noticeable at low motor speeds.

At Fig. 1 is illustrated the air pressure pump utilized on the Cole car, and this form presents advantages in that the pressure supplied is proportional to the speed of the engine. The plunger is actuated by a cam much in the same manner as that operating a valve. Provision is made for increasing or decreasing the amount of pressure carried in the tank by a check valve, which is screwed in or out as the case may require. From 1.5 to three pounds should serve.

Chauffeur's License.

(1609)—Could you tell me where I could get a chauffeur's license? Also, if the one license is good for more than one state, as I live in New Jersey? SUBSCRIBER.

Suffern, N. Y., June 28.

A resident of New Jersey should make application to the commissioner of motor vehicles at Trenton for a chauffeur's license.

There is no license that is good in all states, but according to the provisions of the various laws, a New Jersey chauffeur's license is good for touring purposes, subject to the limitations for non-residents, in the following states: Alabama, California, Connecticut, Delaware, Georgia, Idaho, Illinois, Indiana, Iowa, Kansas, Kentucky, Maine, Maryland, Michigan, Minnesota, Mississippi, Missouri, Montana, Nebraska, Nevada, New Hampshire, New York, North Carolina, North Dakota, Ohio, Oklahoma, Oregon, Rhode Island, South Carolina, South Dakota, Tennessee, Texas, Vermont, Virginia, Washington, Wisconsin and Wyoming.

Polish Formula.

(1610)—In a recent issue of The Automobile Journal I saw a formula for a brass and metal polish. Could you inform me which book it was in? C. W. S.

Newport, R. I., June 29.

The formula referred to appeared in the May 10th issue of The Automobile Journal.

Timing Magneto.

(1611)—Will you kindly inform me how a magneto should be timed on a pleasure, a commercial and a racing car, and when the spark should be retarded and advanced, also what advantage do you obtain? L. S.

Bridgeport, Conn., June 25.

The timing of a magneto would depend to a certain extent upon the design of the motor, bore and stroke, etc. With some types of engines the lead is greater than with others. The Bosch Magneto Company, 225 West 46th street, New York City, publishes a chart showing the proper lead with varying types of motors and this chart was reproduced in the Dec. 25th issue of The Automobile Journal.

As a general rule the magneto is installed so that the contact points of the breaker box open at a certain point, corresponding to a predetermined angularity of the crank throw from vertical, the relation of the piston to the rotation of the crankshaft depending upon the stroke and the length of the connecting rod. The last named factor may be eliminated except in the case of extreme variations. It is a simple matter to learn the piston travel in inches by inserting a wire through an open petcock. Regarding the timing of magnetos on racing cars, they are so set as to provide an early break of the contact points, the advance depending upon the design and speed of the motor.

The advantage of advancing or retarding the

Digitized by Google

spark, either of which is obtained by moving the breaker box, lies in that the contact points are made to separate when the armature is in that position when the greatest efficiency is derived, or in other words, when the greatest number of lines of force is cut. In practise the spark lever is advanced as much as possible without the motor knocking. The subject of timing a magneto is discussed elsewhere in this issue and the points referred to explained.

Timing Valves.

(1612)—In reading The Automobile Journal of April 10th I noticed an article on timing motors when the flywheel could not be used in the work. I am not much acquainted with the timing of valves, but thought it a little strange, which accounts for my writing you. You say that the intake opens .015625 part of an inch late, and the exhaust closes .03125 on the same stroke, which according to my figuring makes both valves open at the same time for a distance of .015625 part of an inch. Kindly publish answer in your next issue. Not being a subscriber to your book you will find enclosed $1, for which you will please enter my name as a subscriber. Also find money enclosed for three of your automobile mechanical books, namely: Engine, carburetion and ignition.

W. W.

Rochelle, Ill., June 27.

The timing plan referred to dealt with the motor of a 1912 Herreshoff car and by again reading the paragraph relating to the timing of the intake valve it will be noted that it states "that the timing of the intake valve is as follows: Inlet opens .015625 inch late; that is, the piston descends that amount on the intake stroke before the valve lifts. The intake valve closes 3.40625 inches late, the piston starting up on the compression stroke before closing. The exhaust valves close .03125 inch after the top dead centre and open 3.28125 inches from dead centre on the downward stroke." The operation of the valves is fully discussed in the motor book, and the opening and closing points illustrated, which will make clear the points referred to.

Auxiliary Mixing Devices.

(1613)—I note that of late a large number of mixing devices for placing in the manifold have made their appearance and that the producers make strong claims for them. As I am interested in any accessory that will improve the running of my motor and cut down the gasoline bills, I would be pleased to have you inform me if these mixers really do what they claim they will.

A PRACTICAL MOTORIST.

Providence, R. I., July 1.

Although the writer has not had any extended experience with the various designs marketed, he installed a certain type in the intake manifold of a car and carefully observed the results. The motor was an old one and there is more or less auxiliary air being drawn in because of worn valve stems, this resulting in a rich mixture on intermediate and high speeds. The mixer was fitted without changing the mixture and improved the operation of the car decidedly, in that the motor was more flexible at high ratios than formerly. Regarding the fuel consumption, careful measurement of the gasoline and over the same route several times developed the fact that considerable more mileage was obtained than formerly. Since then the writer has been able to cut down the gas without decreasing the efficiency of the mixture.

1908 Eisemann Magneto.

(1614)—Can you give me any information about the setting of the points of a 1908 Eisemann magneto? I purchased a car recently having a magneto of this type and wish to reset the points which are pitted and burned, as the gap is evidently too big.

W. M. S.

Boston, July 1.

To adjust the points of the instrument referred to, take off the make and break plate C and pass the brass plug A shown at Fig. 2 through the centre hole C 7 from the back. Loosen the lock nut C 2 of the platinum screw C 3, holding the nut with the wrench provided for this work

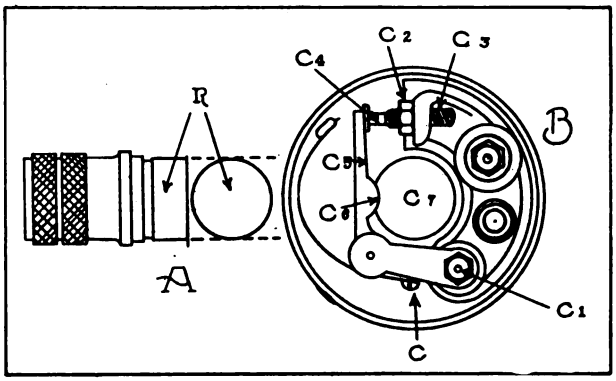

Fig. 2—Adjusting Contact Points of 1908 Eisemann Magneto: A, Plug Employed for Obtaining Break; B, Components of Breaker Box.

while the screw is moved in or out as may be needed in the setting. The proper distance is obtained by using a gauge which accompanies the instrument, and the brass plug referred to was also distributed with the magneto. The lock nut should be secured after the proper gap is obtained, and the make and break plate replaced.

It should be borne in mind that the diameter of that portion R of the plug which is placed through the hole C 7 in the plate is exactly the diameter of the cam at the lift points, so that when the plug is inserted in the plate it raises the platinum point C 4 that exact distance which it is raised when the lift point of the cam is in contact with the member C 6 of the platinum arm C 5. If the plug and gauge did not accompany the machine it may be possible to secure one from the Eisemann Magneto Company, 227 West 57th street, New York City.

Entered as second class matter, April 16th, 1906, at the Postoffice at Pawtucket, R. I., under the Act of Congress of March 3rd, 1879.

EFFECT OF INTERSTATE TOURING.

A careful reading of this Seventh Annual Touring Number of The Automobile Journal cannot help but reveal the effect of interstate touring upon good roads and uniform motoring legislation. There is little difficulty in indicating the economic benefits of improved highways, but there has been a tendency upon the part of legislators to overlook the advantages accruing from uniform motoring laws. However, there is much reason for believing that this situation is gradually undergoing a decided change for the better.

Attention is directed, in this connection, to the digest of American laws, in which it is noted, when comparison has been made with that presented a year ago, that not only have new laws been enacted in a large number of states, but practically every commonwealth now has its motoring law. And while there still remains a deplorable lack of uniformity in many respects, the situation is decidedly improved over that which prevailed formerly.

Insofar as tourists are concerned, very few states fail to grant what amounts to a reciprocity provision, under which non-residents are exempt from the payment of registration fees, and it is in this respect that the greatest difference is to be found. The efforts of the American Automobile Association are reflected in the speed regulations, practically all of which now recognize the "reasonable and proper" provision, but in many instances this is so qualified that tourists, especially, must become informed as to the rate of speed which is regarded as "prima facie" evidence of a speed that is greater than that which is reasonable and proper.

The benefits of good roads are nowhere better understood than in the Far West, where every effort has been made to attract motoring tourists. It has been exemplified to the satisfaction of the business men, as represented by the local chamber of commerce or board of trade, that such motorists in the aggregate leave an immense amount of money in the states which they visit. This fact also has been brought home to some of the states in other sections, notably New Jersey. When it is appreciated in all sections, the movement set on foot this season by New York, New Jersey, Delaware and some of the other Atlantic seaboard states, looking toward a conference of state officials in an effort to formulate uniform motoring laws which shall be all that the name implies, will bear fruit and interstate touring, as well as all interstate use of motor vehicles, will no longer be hampered by the necessity for undertaking a course in interstate law every time it is desired to cross the border.

If the diversified interests of the various countries of continental Europe could be so combined as to make for easy intercommunication by automobile tourists, there does not seem to be any reason why the 48 separate identities of the commonwealths comprising the United States should be so interwoven with the doctrine of state rights that Americans are deterred from "Seeing America First." And there remains the factor of interstate commerce, in which the automobile, both pleasure and commercial, is destined to play such an important part.

CLEANING AND ADJUSTING THE MAGNETO.

Describing the Construction and Operation of Components, Including Make and Break Mechanism and Distributor---Locating and Correcting Troubles---Wiring Diagrams.

(By C. P. Shattuck.)

EVERY motorist who drives his own car should have a practical or working knowledge of the ignition system with which his motor is equipped in order that he may overcome minor troubles at least. Although the magneto gives maximum service with minimum attention, conditions may arise, either through neglect or accident, which will call for cleaning or adjustment. If not familiar with the components of the system, one will be obliged to depend upon some passing tourist for assistance. It is recommended that the ignition system be gone over carefully and thoroughly before beginning the tour and if one is not familiar with cleaning and adjusting magnetos, the work should be done at the nearest service station of the maker or by an ignition expert. It is suggested that the owner watch the operation as a practical demonstration, which, supplemented by the suggestions contained herein, should enable him to overcome ignition troubles.

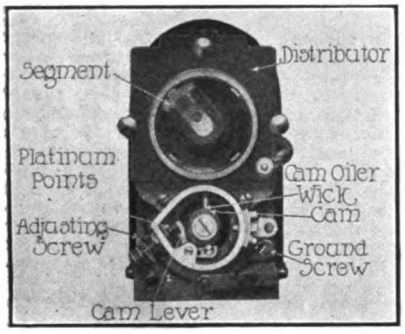

Fig. 1—Illustrating Breaker Box, Its Adjusting Mechanism and Distributor of Remy Magneto.

In the inspection and overhaul of the power plant the primary and secondary wires, terminals, etc., should be examined for chafed or worn insulation and if saturated with oil, it is best to replace the leads with new. The secondary wires need careful attention and if they have been exposed to heat or oils, deterioration of the insulation is apt to exist even if it appears to be in good condition. Many alleged magneto troubles are due to faulty insulation. The maker of the modern car has given this subject serious attention and the high-tension cables are well protected. On the other hand, early types of motors are not thus equipped, the wires being so installed that the insulation loses its efficiency. A judicious use of tape on cables near metal, or touching it, will insure the magneto delivering its maximum output to the plugs.

Operation of Magnetos.

While no attempt will be made to discuss each individual type of magneto utilized for ignition purposes, a description of the operation and function of those components which may be cleaned or adjusted by the motorist will be of value. Magnetos produce electricity by mechanical action through energy supplied by the motor. They may be divided into two classes, high and low-tension instruments, and these may be sub-divided into three types, namely: Double or compound armature (true high-tension), single and inductor (low-tension). With true high-tension magnetos the production of the primary current and its transformation into high-tension, is performed by the instrument itself. The system provides for only one outside primary wire, that leading to the switch and ground, in addition to the cables connecting with the plugs. The low-tension instrument is productive of a current of low voltage which is stepped-up or transformed by an induction coil, this being a separate unit. With this system, the primary current is led from the magneto to the coil, built up, then carried back to the instrument and distributed to the plugs in proper order by the distributor. The majority of the low-tension magnetos provide a dual system in that current from dry cells or a storage battery, the primary circuit, is broken by the interrupter of the magneto, built up by the coil, and distributed by the instrument. There are two types of dual systems, one in which the circuit breaker and distributor of the magneto are employed for both the battery and magneto currents, and the other in which a separate breaker mechanism is used for the battery current. It is important that the motorist become familiar with his equipment as the knowledge will greatly facilitate the correction of troubles.

Operation of Interrupters.

The drive of a magneto is important, it varying according to the number of cylinders. With two and four-cylinder, four-cycle engines the magneto is driven at crankshaft speed; with three-cylinder, three-quarter; and six-cylinder, 1.5 times crankshaft speed. Two-cycle

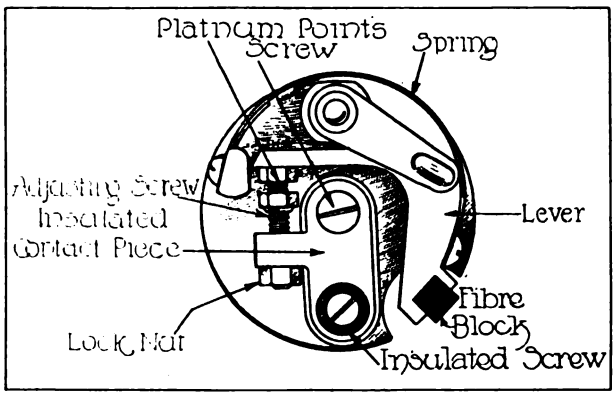

Fig. 2—Showing the Components of Bosch Breaker Box—The Points Are Adjusted by Screw Member on Insulated Contact Piece.

engines, with the exception of two-cylinder units, are driven at double the speed of that of the four-cycle. The drive must be positive for any slipping of the connection between the magneto and driving member will throw the instrument out of time. This should be re-

Digitized by Google

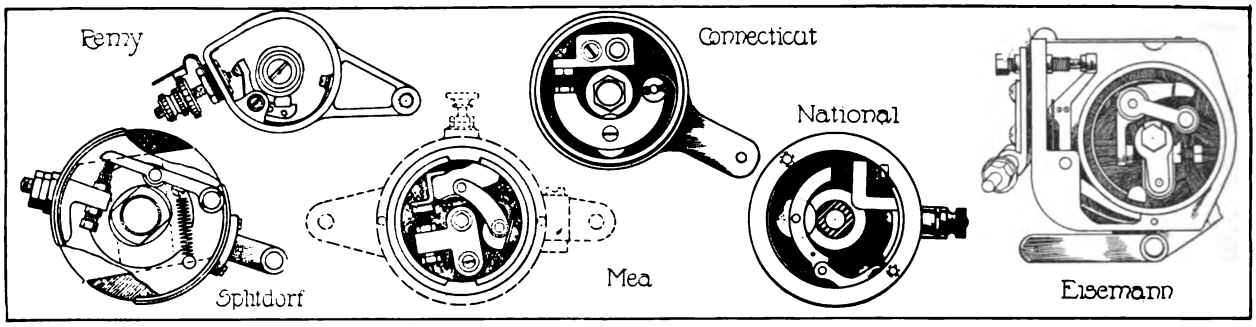

Fig. 3—Illustrating Components of Breaker Boxes of Conventional Types of Magnetos, Also Showing Operation of Contact Points.

membered in replacing a magneto which has been removed for repairs, etc.

There are two components of the magneto which the owner may clean and adjust, and aside from oiling in accordance with the instructions of the maker, no attempt should be made to take the instrument to pieces to see how it operates. The principle of the breaker box or interrupter mechanism, so-called because it interrupts the primary circuit and practically establishes the time of the spark, is similar in all types. They differ in that some have stationary mechanism; that is, the interrupter lever, contact points, etc., do not move, the break being brought about by a cam fixed to and rotating with the armature shaft. The other type utilizes segments attached to the breaker box and these actuate a lever revolving in common with other parts of the mechanism.

Components of Breaker Box.

One of the last named type is illustrated at Fig. 2, the design being a Bosch. It comprises an insulated contact piece carrying an adjustable screw, a pivotally mounted lever having an arm with a screw and a spring. These components are mounted on a metal disc which is keyed or attached to the armature shaft, revolving with it. It will be noted that the lever carries a fibre block which projects beyond the periphery of the disc. It will also be seen that the spring has a tendency to keep the platinum point on the lever arm in contact with the platinum point on the insulated contact piece.

When the armature shaft rotates the fibre block comes in contact with a segment in the housing, which is stationary normally, moving the block inward or depressing it. This causes the upper platinum point to break contact with the lower or fixed member, and to interrupt the primary current at the proper and predetermined instant.

Examples of the cam type are noted in the Remy, Splitdorf, Connecticut, etc., illustrated at Fig. 3. These show four-cylinder magnetos, and that the cam fitted to the armature shaft has two points, which come in contact with a pivotally mounted lever carrying a contact point, moving it away from a fixed point. Connection between these platinum points is established and broken twice during each revolution of the armature shaft, producing two breaks and consequently two sparks. With two complete revolutions, four breaks are made and four sparks derived.

As the high-tension current is induced at the instant of the break, and the interruption must take place when the armature is in a certain position to obtain the greatest efficiency or intensity of spark, it will be seen that it is important that the time of separation established by the maker must be maintained. Too early or too late a break results in inefficiency.

Provision is made for the adjustment of the platinum contact points. Referring once more to Fig. 2, it will be seen that the fixed member on the contact piece is secured by a lock nut. By unloosening this the screw may be moved in proper relation to the movable point. The Splitdorf, Mea, Eisemann and National are adjusted similarly.

The Remy differs from those mentioned in that the distance between the points may be varied from the outside of the breaker box and with the motor operating. The mechanism is shown at Figs. 1 and 3, and it will be seen that it is a simple matter to move the adjustable screw in or out.

Cleaning Contact Points.

It is important that the platinum contact points be true and be kept clean. They require attention only after considerable use and in some instances have been known to remain in good condition after several thousand miles of service. Lack of space prevents giving definite instruction for removing and cleaning points of all types of magnetos, but when the platinum is pitted it should be smoothed with a jeweller's file, taking care not to remove too much of the metal and to have the points true.

The majority of manufacturers provide a gauge and wrench for setting the points, the former being utilized to obtain the correct space, and the latter to fit the lock nuts and hex heads of the screws. If the owner does not possess the tool it is recommended that one be secured, as setting the points by guess work will not give satisfactory results.

The correct gap or separation should be adjusted with the fibre block resting on a segment, with the Bosch type for example, and with cams vertical with the cam type, as illustrated in the Remy at Fig. 1. This causes separation of the points, permitting use of the gauge. By utilizing the gauge accompanying the magneto it is a simple matter to reset the fixed screw. The distance recommended by the makers of different magnetos is as follows: Bosch, .4 millimeters (a millimeter is .03937

inch); Splitdorf, .03125 inch; Remy, .025 to .030 inch; Mea, .015625 inch; National, .03125 inch; Eisemann, .015625 inch; Connecticut, to gauge; Pittsfield, .015625 inch. It is important that the lock nut be set up tightly after adjusting. Lubricant should not be used in the breaker

boxes of magnetos in which fibre is employed, such as the Bosch for example. In the Remy the cam is lubricated by an oiler wick, while the maker of the Splitdorf recommends the application of a little oil, applied with a toothpick, to the little roller on the breaker bar.

Distribution of Secondary Current.

It has been explained that the high-tension or transformed primary current is led to the proper spark plug by the distributor. This includes a rotating arm, which, with four-cylinder types of magnetos, makes one complete revolution to two of the armature shaft, and in an opposite direction. The distributor is easily accessible by removing the cover, and that of the Remy is shown at Fig. 1. As the arm comes opposite one of the four segments, the high-tension current flows through it to the wire and the spark plug.

A knowledge of the direction of rotation of the armature shaft is important in the event the instrument is removed or the cables displaced from the distributor. Let it be assumed that the secondary wires have been removed and the motor cranked in the meantime. The first step is to ascertain the firing order of the cylinders and the direction of rotation of the armature shaft. Suppose the motor fires 1, 3, 4, 2, and that the magneto runs clockwise, looking at the driving end. Under such conditions, as illustrated at Fig. 4 A, the distributor arm would be rotating anti-clockwise when considered from the driving end, but clockwise when viewed as shown in the drawing and as indicated by the arrows.

It would be necessary to bring the piston of the first cylinder to the position shown in the sketch, which is at the completion of the compression stroke. As the magneto was not removed the distributor arm should be in contact or opposite the segment marked 1. The connection between it and the spark plug of the first cylinder is made by the cable. The next cylinder to fire is the third, but the next contact to be made by the arm is the second segment, consequently the wire is attached to 2 of the distributor and connected with the plug of the third cylinder. The fourth cylinder explodes third, and the second last. At C is shown the wiring plan of a motor firing in a similar manner, but with the armature rotating anti-clockwise. The wiring of a motor firing 1, 2, 4, 3 is illustrated at B. As the secondary leads are numbered according to their proper location in the distributor housing, and the cylinders numbered in order, one should not experience any difficulty in replacing wires and timing. Some makes have a timing pin. Oils or greases must not be used in the distributor nor dirt or dust allowed to accumulate. The only attention these members require is an occasional cleaning with a soft brush. The cover should be replaced carefully and all binding nuts, etc., tightened.

High-Tension Magnetos.

One of the advantages claimed for the true high-tension magneto is the simplicity of the exterior primary wiring. But one primary wire leads from the breaker box to the switch, thence to the metal or ground, being employed to divert the primary current from the secondary winding and to stop the motor. If the motor fails to stop when the switch lever is moved to its proper position it may be due to a faulty connection. The ignition may be cut off by making a connection between the terminal on the breaker box and any metal of the motor, using metal for the connection. If the engine fails to start or stops abruptly on the magneto, disconnect the wire leading from this terminal to the switch and crank the motor. A chafed primary wire in contact with the metal of the car will produce a short circuit, and removing the lead will show if one exists.

Missing at low speeds denotes that the spark plug gaps are too wide, secondary wire disconnected or short circuited, dirty interrupter points, fouled plugs, etc., while an occasional miss may be traced to a defective spark plug or cable, or loose switch parts. Similar conditions may also prevail at all speeds.

Low-Tension Magnetos.

The circuit breaker and distributor of the low-tension magneto are cleaned and adjusted in the same manner as with the other instruments. When the system is a dual one, and batteries are utilized for starting and for an auxiliary source of supply, failure of the motor to start on these members may be due to a number of causes. The first step is to ascertain if the batteries are wired properly; that is, the binding nuts of the cells set up snugly and no broken wires exist. It is equally important to know that the cells have not run down through service or short circuiting. If the batteries test to the standard, examine the wires leading from them to the coil, magneto, etc.

Inspect the brush making contact on the cam or similar member conveying the battery current to the breaker box of the magneto. Some times in replacing the dust cover the brush does not make proper contact. If the brush is in order, have someone crank the motor and note if the platinum points separate and if the distance is correct. Another source of the trouble may be dirt in the distributor housing. Examine the brush in the distributor cover and note if it makes proper contact with the distributor. Go over all wires between the magneto and coil and make sure that none is grounded or no terminals are loose. These tests are suggested in the event the motor fails to start on either the batteries or the magneto, and when the fault is not due to carburetion or engine troubles.

Locating Troubles.

Locating a missing cylinder is a simple matter and is best performed with the engine operating. Take a screw driver with a wooden handle and short circuit a plug at a time by connecting the metal terminal of the cable with the metal of the engine by means of the blade of the tool. Be careful not to touch any metal with the fingers or a shock will be experienced. By having the cut-out open, one can distinguish by ear whether the cylinder being tested is at fault. The secondary current of each cable can be tested in a similar manner, by holding the point of the screw driver blade about .25 inch away from the cylinder. The spark will jump the gap.

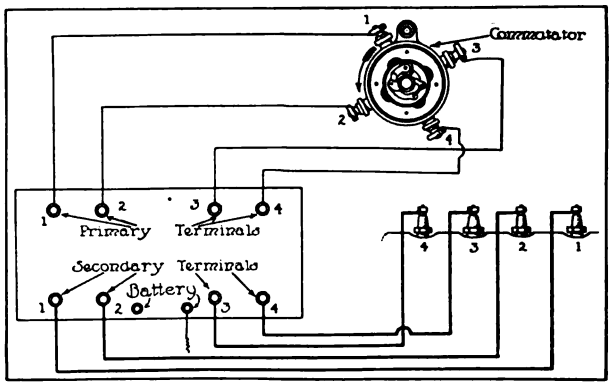

Fig. 6—Wiring Plan of Induction Coil and Commutator with Four-Cylinder Motor Firing 1, 2, 4, 3.

Otherwise, the cable is defective or is not properly fitted in the distributor housing.

It is difficult to give any set rule as to the gap of the plugs. Some makers of magnetos advise a gap of .03125 inch, while others recommend .015625, while one

Digitized by Google

maker suggests anything between these points. It is best to adhere closely to the instructions of the maker and as all manufacturers issue comprehensive data free, the writer suggests that those not possessing an instruction book write for one and carry it on the car during the tour. The oiling instructions should be followed carefully.

The practise of many car manufacturers to fit the magneto with a cover is an excellent one and the utilization of these protectors eliminates opportunity of water and dirt reaching the working parts of the instrument. As the machine will be washed in strange garages during the tour the workman may flood the magneto with water, creating trouble, although some types of instruments are so constructed as to be dust and water proof.

While the magneto has supplanted the battery and coil system of ignition to a great extent, there are a number of machines utilizing the older form of ignition. At Fig. 6 is presented the wiring plan of a four-cylinder motor firing 1, 2, 4, 3, and with the commutat r rotating anti-clockwise. The wiring plan of both the primary and secondary wires is shown and will be of service to those not familiar with this form of ignition.

Fig. 5 illustrates how dry cells are wired in series and multiple series, the sketch at A showing six cells in series which increases the voltage, but not the amperage, while that at B provides for greater amperage. In the event the magneto becomes disabled, by utilizing two sets of six cells and wiring them as shown at B, considerable service will be obtained—sufficient to operate the motor on the battery type of timer or distributor until the magneto is returned from the factory or service station. Care must be taken to use only the number of cells recommended by the maker of the magneto, as the voltage required varies.

CLEANING PARTS WITH SODA.

Pierce-Arrow Motor Car Company Utilizes Hot Solution Instead of Gasoline.

The expense involved in the use of gasoline for cleaning parts in the assembly and other rooms of a factory and service station is considerable and is augmented in these days of the high cost of fuel. The Pierce-Arrow Motor Car Company, Buffalo, N. Y., has eliminated gasoline and its attendant dangers by the utilization of hot soda water, which is not only cheaper, but is held to be more efficient as a cleanser. The system comprises a soda and a hot water tank which are heated by steam, although it is pointed out that the invention could be supplied with the necessary heat by gas, the only alteration required being that of raising the tanks slightly.

According to J. Willard Lord of the service department of the company, the soda tank is supplied with about 25 pounds of soda weekly, the amount depending upon the nature of the parts to be cleaned. If the work for several days happens to be of a very oily nature it is found that a certain amount of oil and scum will form on the top of the solution, indicating that it is weak. This condition is easily remedied by the addition of a few pounds of new soda. The tanks are cleaned once a week and the heating coil in the base of the container requires attention semi-monthly.

The hot soda tanks are employed throughout the assembly department and digression is made only in the case of the final test gang in the motor assembly room. These men take apart and clean the motors after being received from the block testing department. In this work the parts are first washed in gasoline, because of the very heavy deposits of oil, then by the hot soda process, and dried with compressed air.

INTERESTING WORLD TOUR.

Two Young Men Leave Indianapolis in Henderson Car for Year Abroad.

Edwin P. Kohl, who has just graduated from the University of Wisconsin, left Indianapolis, Ind., July 1, in a Henderson car, made by the Henderson Motor Car Company, that city, for a tour around the world. He expects to arrive at San Francisco July 1, 1915, during the Panama Pacific exposition. He will be accompanied by a Harvard graduate, who is an expert photographer and is an experienced automobile driver.

They will not follow the beaten paths, but intend to visit nearly every civilized country on the globe. Following are some of the places included in the itinerary: New York City, sail to Liverpool, touring England, Scotland and Wales, France, Spain, Italy, Switzerland, Germany, Belgium, the Netherlands, Russia, including St. Petersburg, Samara, Moscow and Warsaw; Austria, including Vienna. The Balkan States will be crossed to Constantinople, following the Mediterranean and the Suez Canal to Cairo and Alexandria in Egypt. The Holy Land will be visited and then the route will be laid across Arabia, Persia and India to Calcutta, across the mountains into China and sail from Shanghai to Japan. The Philippines and Australia will then be visited, following which shipment will be taken to Buenos Aires, Argentina. The drive will then be along the east coast to Panama and northward to San Francisco along the west shore of Mexico.

Ten Buick cars, made by the Buick Motor Company, Flint, Mich., recently left Lincoln, Neb., each having seven gallons of gasoline in its tank. They went to Omaha, Neb., going through the cyclone district, which made the total distance 70 miles flat. Upon arrival at Omaha, 4.5 gallons of every seven were drained from the tanks, showing an average of 28 miles a gallon. As the trip was made over rain soaked roads, this record is considered excellent. The journey occupied 3:45:00, inclusive of all stops.

TO REOPEN RECENT PATENT DECISION.

Detroit Manufacturers Anxious to Determine Their Position with Reference to Price to Consumer—Interesting Discussion of the Problem.

THE automobile industry is by no means satisfied that the recent decision of the United States supreme court, with reference to the effect of the patent law upon the fixing of retail prices, is final. It is reported from Detroit that the motor car manufacturers in that city have retained Attorney Alfred Lucking in an effort to reopen the matter.

It will be remembered that something over a year ago this court handed down a decision in the so-called Mimeograph case, Henry against Dick, in which a mimeograph was sold at cost with the restriction that the paper and ink should be bought from the company selling the machine. At that time the court held in favor of the patentee on the ground that the owner of the patent had not relinquished his interest in the machine, inasmuch as it was sought to obtain a profit from the sale of paper and ink.

In the recent decision, the case being that of the Miles Medical Company against Clark and others, it was held that "to vend is to part with a thing for a consideration," and that the owner of the patent had disposed of his interest in the patented article when it passed into the possession of the first purchaser—the jobber, for instance.

The layman finds difficulty in following the sharp distinctions made by legal interpretations. The automobile industry has been at some loss to understand the effect of the latter decision of the supreme court. Some manufacturers have maintained that it would not affect the establishment of fixed prices where cars were sold through agents, while others are of the opinion that in order to maintain prices it would be necessary to establish numerous factory branches. Apparently, there is a desire to learn exactly where the industry stands in this matter, and it is anticipated that a test case will be taken to the supreme court in order to obtain this information, although it is possible that the same result can be accomplished by reopening the Miles-Clark case.

Perhaps one of the most interesting and instructive articles covering the phase raised by the recent decision of the supreme court, is that by Harry D. Nims, a member of the bar of New York City, in The Outlook for June 21, under the title, "Price Protection and the Consumer." Mr. Nims says in part:

A. T. Stewart achieved a world wide reputation some years ago because he installed in his store what was known as a one-price system, and ended, in his business, for good and all the question of "dicker" between his clerks and his customers. His goods bore their price, and the customers could take them or leave them at that price. * * *

Price-cutting presupposes a known price and value which prevails generally in the community. The cut price appeals only to persons who recognize it as lower than a well known higher price which they have customarily paid for the article in question. It represents a revolt against the attempt of the manufacturer to sell his goods on a one-price-to-all basis. In reality, therefore, the price-cutter is a reversion to the time antedating Mr. Stewart's famous reform.

Mr. Stewart evidently believed that, while there were many business transactions in which bargaining was necessary and useful, in his business relations with the public over the counter of his store bargaining had no place; and the public has agreed with him ever since that time. * * *

The most important consideration, so far as the public is concerned, is, of course, that the play of the laws of competition shall not be suppressed or curtailed; that the consumer should be afforded an opportunity to choose from and inspect as large a number of the articles as possible which are on sale to meet the purpose for which he is buying. If this be true, this end will by no means be met by merely affording an opportunity to retailers to sell the goods on their shelves at any price they see fit. In addition, there must be preserved, by some method, an opportunity by which goods can be sold in many places—be easily inspected by the buying public.

There is one form of restraint of trade which is not always taken into account in a discussion of this question; namely, that which results from the elimination of the small dealer—the local store—by reason of the methods of the mail order house and department stores, which, by their constant so-called "sales," so depreciate the value and injure the reputation of standard goods as to render business unprofitable for the small dealer.

This change in the conditions under which goods are sold has not in any degree abrogated the economic laws of competition. But it has changed the conditions under which they exercise their beneficent influence upon trade. The operation of these laws in the small communities of 50 years ago was evident to the most casual observer. Today, so ramified and intricate are the methods by which business is done, and so silent are its processes, and so extensive its operation, that even those who are best posted upon these conditions hesitate to define exactly the economic laws which underlie present day trading.

These being the conditions of the market, the manufacturer of branded goods has, generally speaking, for some years past sold his goods to the retailer and the jobber in such a way as to insure that the price at which his goods shall be bought by the public shall be uniform everywhere throughout the country. By advertising he has created a demand for his goods, and his idea has been to sell them on the same basis as if every user of them came to his own counter at his factory and bought directly of him. Despite the apparent good reason for this, from a buyer's point of view, as well as from that of the manufacturers, the courts, generally speaking, have considered that the means so far used to accomplish this result have been against public policy, and therefore illegal.

Had every manufacturer maintained a store, and sold all his goods at retail, it is difficult to see how the manufacturer's "one-price-to-all" policy could be less commendable or less generally beneficial than is the Stewart plan for a retail merchant. Evidently the public would benefit were such a plan possible; and is it solely because such a distributive method is impossible for the manufacturer that this problem has arisen? The average manufacturer must, in the nature of things, sell to jobbers if he is to be able to offer his goods widely to the public,

Digitized by Google

keep his price down to a reasonable figure, and avoid bad retail accounts in districts too remote for him to know or learn the standing of the retailers. Where jobbers' services are unnecessary he must still sell outright to the retailer, because he usually has not the capital necessary to own his goods both while in process of manufacture and while on the retailer's shelves awaiting purchase by the public. In other words, he must, in order to distribute his goods widely, usually sell them outright to jobber or retailer, who, in turn, will sell to the consumer.

These sales to jobber and to retailer result in injecting into the situation several legal rights and principles on which the price-cutter bases his legal rights, and which form also the basis of the charge that the manufacturer, in protecting prices, is restraining trade.

The most important of these rules is that, whenever a person has sold absolutely and without condition a piece of personal property belonging to him, he has no further dominion or control over that property. This is a general rule. It is possible, however, under certain circumstances, to attach to the sale of personal property a condition; as, for instance, an artist selling his painting or a sculptor his statue might stipulate in the sale that the buyer should not resell it for less than a stipulated sum. Such a stipulation would probably be legal.

But when we attempt to apply this doctrine to the distribution of goods, we meet with another rule of law, namely, that all contracts which have the effect of unreasonably restraining trade or suppressing competition are void. The supreme court has apparently held that it is unlawful for a manufacturer to affix to every sale of his goods a stipulation of this sort, because the result of his so doing is a restraint of trade—a suppression of competition. Undoubtedly such agreements restricted competition as it existed 50 years ago, but there is grave doubt in many minds if such an agreement has this effect upon the competition of today.

* * * As we have seen, were all the producers of all the articles used in a community located in the community, and did all of them sell directly to the consumer, competition would be defined easily. Each one would be free to fix his price at will. If A and B made watches of equal value, and A charged $10 for his while B charged $5, no one would attempt to prevent A from fixing that price for his own goods. Competition between the two watches would soon compel either the lowering of A's price or his retirement from business. A Sherman law might well be passed in such a city to prevent A and B, and all watchmakers in the community, from combining and agreeing to sell all watches of that grade at $10. That done, the interest of the public would be safeguarded by the economic law of competition—the freedom of the public to decide which article was cheapest.

But as conditions are at present are we not losing sight of the real issue, when once the Sherman law insures us against such combinations, in attempting further to say, as our courts are now doing, that because A must employ a jobber and a retailer to distribute his goods, the jobber and retailer shall be free to sell A's wares at any price they will? Are we not forgetting that, after all, true competition is not between retailers and jobbers of these rival articles, but between the rival articles themselves?

It is of interest to note, as is brought out in Mr. Sims' article, that this view already is held in several states, notably California, New Jersey and South Dakota, which have enacted laws permitting, in the absence of combinations among dealers, the manufacturer to fix his price and prevent the price-cutter from destroying it, or forbidding retailers, for the purpose of destroying competition, to charge a greater price in one community than in another, considering any differences in freight charges from the place of manufacture to the dealer's store.

Denmark has passed a law provided for the fining of persons who "sell or offer for sale goods in original wrappers from producers or jobbers, upon which their fixed prices for the retail trade have been indicated at a lower price" (except in case of sales of damaged goods, sales by reason of removal or retiring from business, etc.), unless permission of the maker or jobber is first obtained. German courts have recently held that the sale of goods by price-cutting methods is a violation of the German law against unfair competition, for the reason that such acts damage the maker's property by creating the belief that its goods can be bought at different prices at retail. Decisions of a similar tenor have been handed down in Belgium.

CROW COMPANY EXPANDING.

New Machine Shop Ready for Occupancy and More Land Is Acquired.

A new machine shop affording 5000 square feet of floor space has been built adjoining the south side of the Crow Motor Car Company's plant at Elkhart, Ind. The ever increasing demand from all parts of the country for Crow Elk-Hart motor cars has made it necessary to expand the factory and to install new machinery. The new structure was built to give plenty of light and will be utilized as a machine room. The floor is of concrete, to give a solid foundation for the heavy milling machines, lathes, drills, etc.

A large tract of vacant land west of the plant has also been acquired. At present this property is being used for switching purposes, but will accommodate other factory buildings when the volume of business indicates that additional floor space is needed. Adequate fire protection has been provided, the factory being equipped with an automatic sprinkling system. The latter comprises 10,000 feet of pipe with more than 1000 release heads. Heavy pressure is furnished at all times as the system is connected with both the city water supply and with a tank of 33,400 gallons capacity, which rests upon a brick tower and rises 60 feet above the ground.

A new, large elevator has been installed to hoist the heavy six-cylinder machines from one floor to another, the old elevator being used for the smaller models, thus effecting a great saving of time. The 1913 season has thus far been a notable one in the manufacturing career of the Crow Motor Car Company. The sales of the product have not only increased in all parts of the country, but in the foreign fields as well. At present there is a day and night shift employed in the factory and the work progresses with very little intermission.

SELLING ADDITIONAL STOCK.

Expected That It Will All Be Taken by Present Henderson Stockholders.

At a recent meeting of the stockholders of the Henderson Motor Car Company, Indianapolis, Ind., maker of Henderson cars, it was voted to sell the remaining unissued shares of common stock, amounting to $100,000. It is anticipated that all of the new issue will be taken by the present stockholders in the Henderson company.

"The Hendersons of Indianapolis" as the Henderson brothers are generally known in the industry, are by no means new in the motor car business, although they have been operating a factory under their own name for a little more than a year. The first Henderson car made its appearance during the second annual 500-mile race on the Indianapolis motor speedway, Memorial Day, 1912. The features of this initial product included the use of wire wheels, left hand drive, seat control and cowl dash and gasoline tank. The 1914 models, announced recently, go a step further, including a kerosene carburetor as optional equipment.

SECURES MORE LAND.

Stearns Company Doubles Capital and Will Increase Production Facilities.

In order to increase production facilities necessitated by a rapidly expanding business, the F. B. Stearns Company, Cleveland, O., maker of Stearns-Knight cars, has doubled its capital stock, bringing the total to $400,000. Following the filing at Columbus, O., of the papers incident to an increase in capitalization, it was announced that the company has purchased nearly 400 feet of land adjoining its plant on Euclid avenue.

Control of this land was acquired some time ago by a group of men identified with the Stearns company and they for the time vested it in a real estate company. It is understood that an agreement was reached whereby the automobile company made a conditional exchange of its stock for securities of the realty concern. The land lies west of the Stearns company's plant.

BUYS ANOTHER PLANT.

Saurer Motor Company Acquires Additional Property in Plainfield, N. J.

Indicative of the expansion of the automobile truck business is the purchase by the Saurer Motor Company, Charles P. Coleman, president, a subsidiary of the International Motor Company, of the plant of the Manganese Steel Safe Company, on West Front street, Plainfield, N. J., near the Clinton avenue station of the Central Railroad of New Jersey.

The Saurer Motor Company was incorporated several months ago with capital of $1,600,000. It is reported that it has expended $250,000 in extensions of its plant and a considerable additional sum will be spent on the property just acquired.

JOINS APPERSON COMPANY.

W. D. Edenburn Leaves Henderson Concern on Eve of the Transcontinental Tour.

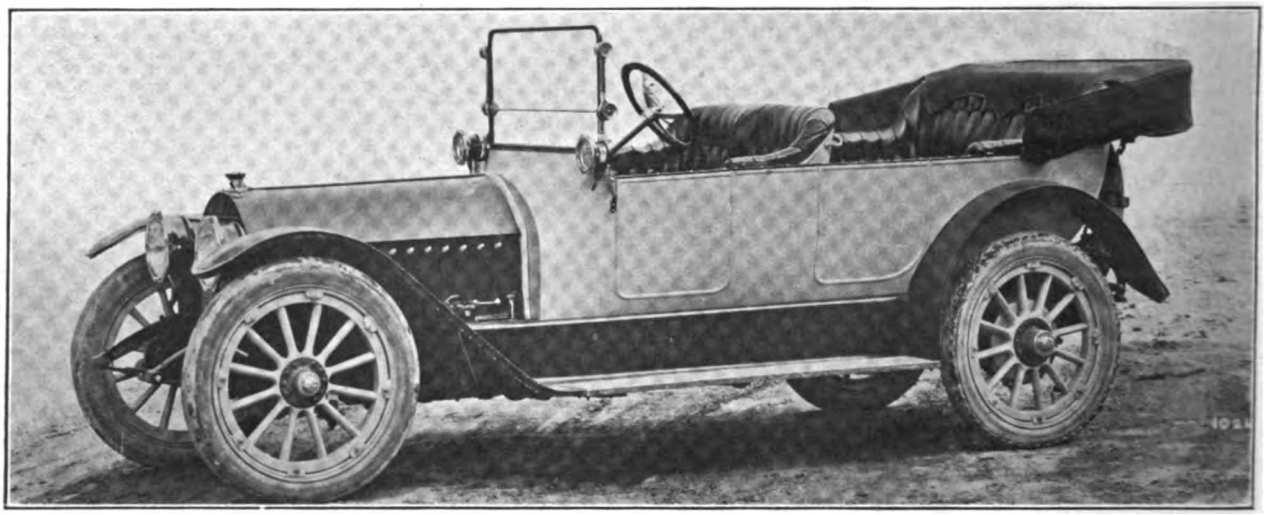
W. D. Edenburn, a former Indianapolis newspaper man, who has been connected with the automobile industry for some time, has resigned as manager of the newspaper department of the Henderson Motor Car Company, Indianapolis, Ind., maker of Henderson cars, to join the organization of the Apperson Bros. Automobile Company, Kokomo, Ind., maker of Apperson machines. His resignation is effective immediately and he is representing the Apperson company on the Indiana-Pacific Coast tour, which started from Indianapolis, July 1.

W. D. Edenburn, with Apperson Bros. Automobile Company.

Mr. Edenburn has been one of the most active men in the promotion of the third annual tour of the Indiana Automobile Manufacturers' Association. He is chairman of the special features committee of the tour and assistant chairman of the event. W. McK. White, advertising manager of the Marion Motor Car Company, maker of Marion cars, is chairman of the tour committee, and the management of the run while en route will devolve largely upon Mr. Edenburn and Mr. White.

Digitized by Google

NEW 6-48 ADDED TO KISSELKAR LINE.

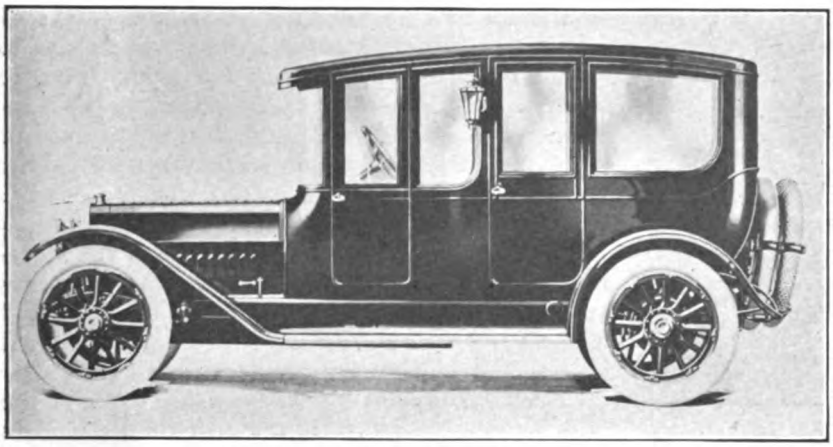


ANNOUNCEMENT was made recently of the acquisition of a new plant at Milwaukee, Wis., by the Kissel Motor Car Company of Hartford, Wis., maker of the well known KisselKar line of pleasure and commercial vehicles. Indicative of the progressive policy of the company is the appearance of a distinctly new chassis which will be constructed at the new factory and which will be known as the 6-48, instead of being designated as a particular model, the company having abandoned the yearly model system.

Although the latest creation embodies those mechanical features which have proven the durability of the Kissel product, there are several particulars in which the new design differs from previous chassis. The most striking change is the substitution of left hand drive and centre control for the right. Another is the casting of the motor en bloc instead of in pairs as with the older six. The third feature is the tendency toward a long stroke, the new motor having a 3.75-inch bore and 5.2-inch stroke which shows an increased bore to stroke ratio when it is considered that the 6-60 motor is 4.5 by 5.25. Another noteworthy change is in the design of the frame, which has a double drop, affording opportunity to utilize a straight sill for the body throughout the greater part of its length, as well as making for greater stability through a low centre of gravity.

The new KisselKar is of such size as to meet the approval of those who desire the comfort, conveniences and capacity of a large machine with a minimum cost of maintenance. It may be termed an intermediate size, but its details indicate that it possesses those advantages afforded by the high powered car. The appointments throughout are very complete and unusual attention has been paid to working out those details which contribute to the comfort of motoring. Three body styles are fitted to the new chassis, these including a five-passenger touring, a limousine and a fore door limousine. The bodies are very attractive, having clean lines, which are enhanced by the utilization of round pressed steel fenders of foreign design. The equipment is very complete, including electric lighting and motor starting.

The motor is a new design, although certain well known features of KisselKar construction have been retained. As previously stated the six cylinders are cast en bloc and the bore and stroke of 3.75 by 5.5 inches developes 33.75 horsepower according to the S. A. E. formula. The company's rating is 48, which appears to be conservative when the piston displacement is taken into consideration. The power plant is very compact and the exterior components are neatly finished, presenting an attractive motor when the hood is lifted. It is of the L head type with valves located on the left and their mechanism is enclosed by easily removed plates.



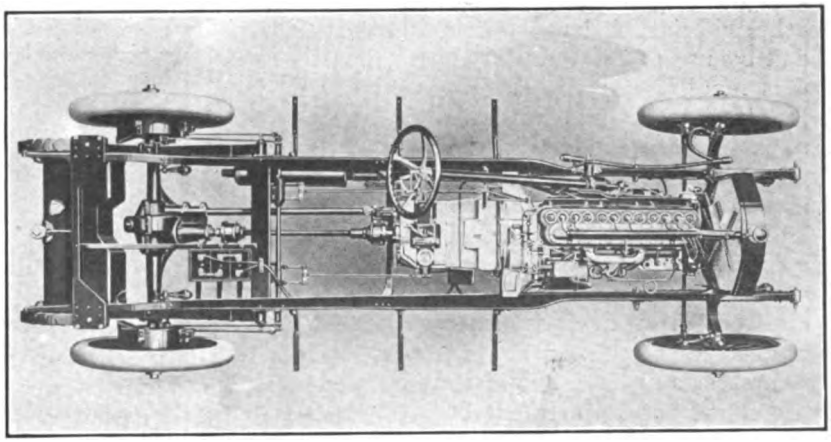
Carburetion is by the latest type automatic float feed Stromberg, water jacketed for cold weather and having the Stromberg device for restricting the air when starting the engine. The usual steering post control is included, making

KisselKar 6-48, the Initial Product of the New Kissel Plant at Milwaukee, Wis.—An Attractive Design and Noticeable for Its Clean Lines.

Digitized by Google

for convenience in regulating the mixture. Owing to the double drop of the frame, the carburetor is mounted slightly higher than in conventional

Fore Door Enclosed Limousine, One of Several Types of Bodies Fitted to the New Chassis.



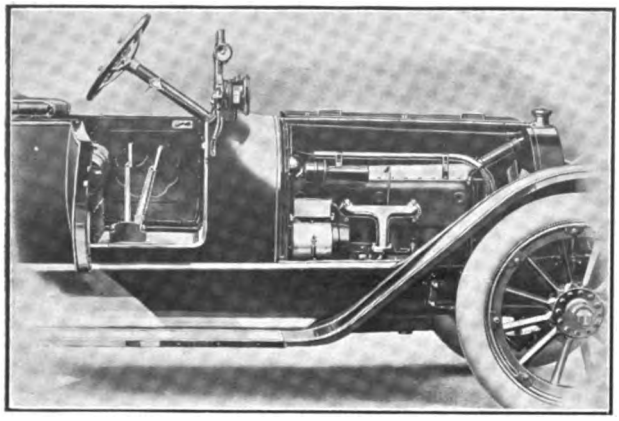
practise, and the construction permits of a shorter intake manifold. The latter is well designed, being free from curves, and should make for efficient carburetion.

Ignition is provided by the latest type Mea, a water proof instrument, which is mounted in front and slightly to the right. Both the magneto and water pump are driven by a transverse shaft and these members are very accessible. The diameter of the exhaust manifold and the straight line pipe to the muffler located amidships of the chassis is such that back pressure is reduced to a minimum.

Cooling is by a square tube radiator so mounted that road shocks are eliminated. Cooling is further aided by a belt driven fan with means provided for preserving the proper tension. The outlet water manifold is a single casting retained by studs and it is an easy matter to displace it in the event the water jackets require cleaning. The motor starter, an Esterline, is mounted at the right of the rear cylinder, energy being supplied to the motor through a gear meshing with teeth on the flywheel. Many refinements are noticeable in the power plant, these including the carrying of the high-tension wires in a neat tube and the mounting of the electric horn under the hood.

Lubrication is by the conventional splash and force feed. A noteworthy feature is the provision made to guard against smoking. The lower edge of the bottom piston ring groove is bevelled off and holes are drilled at right angles through the piston. Any surplus oil accumulating on the cylinder walls is scraped off by the bottom ring, carried through the openings in the piston, thence to the crankcase, obviating the possibility of passing by the rings into the combustion chamber and creating smoking. Oil ducts in the crankshaft distribute lubricant to all bearings. Force feed lubrication is obtained by the gear pump, the lubricant being stored in a self-contained reservoir in the lower part of the crankcase. Its capacity is two gallons.

The motor, clutch and transmission are a unit, and the accessibility of the former KisselKar amidships location is retained. The motor and clutch are together and are suspended by a special construction with one bearing in front, one in the rear and one on either side. The gearset also has a three point support, one being a trunnion on a cross member at the rear of the transmission, the others being the arm supporting members of the motor. This is obtained by means of a housing which encloses the clutch and the universal joint between it and the gearbox, and which is integral with the flywheel housing. The method of suspension should relieve components



Top View of New KisselKar Chassis, Showing the Block Motor, Double Kick-Up Frame and Accessibility of Components.

of all undesirable stresses due to rough roads.

The transmission is of the selective sliding gear type, providing four forward speeds and a re-

Digitized by Google

verse, with direct on the third. The gears are of chrome vanadium steel and the shafts are mounted on F. & S. annular ball bearings. The clutch,

Simplicity and Accessibility Are Features of the Motor Which Is a Unit with the Clutch and Transmission and Is Carried on a Three Point Suspension.

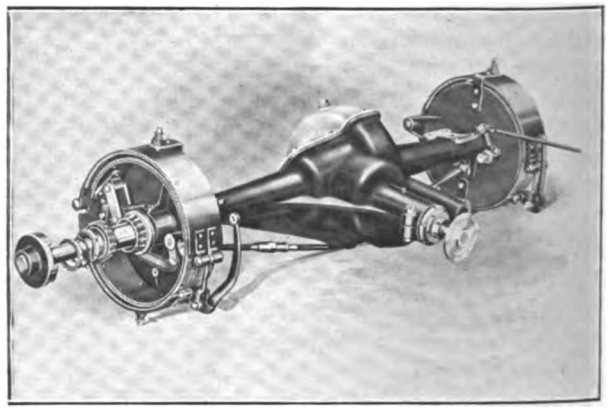
flywheel and transmission are very accessible through large inspection plates. The clutch is large, of the leather faced cone type, with adjustable spring inserts, making for gradual but positive engagement. It may be disassembled without removing the motor or gearset.

Energy is transmitted from the gearset to the axles through an unenclosed shaft with a universal joint at either end. An ample sized torsion rod from the axle to the cross member at the rear of the transmission takes the drive and cares for torsional effect. It is rigid at its rear end and trunnioned at the front, running parallel with the drive shaft.

The rear axle is of the floating type and the housing is tapered slightly from the differential to the wheels. A large factor of safety is provided by use of reinforcing webs. The differential is readily accessible through a large inspection plate or housing and the entire rear construction is such that adjustments may be made easily. The housing is further supported by an adjustable strut rod.

The brakes are unusually large, two sets being provided. The service members are actuated by pedal and are of the external contracting type, while the emergency set is operated by the conventional lever. The brake drums are 24 inches in diameter and have five-inch faces. Equalizers are utilized and adjustment of the brakes is accomplished easily.

Semi-elliptic springs are employed both front and rear, these members being of chrome vanadium steel. The front springs are 38 inches long and 2.5 wide, while the rear members are 52 by 2.5. Each leaf is carefully ground and provision is made for lubrication of the parts subject to friction.



The frame is of pressed steel, narrowed in front to provide a short turning radius, and has a double kick-up, making for a low centre of gravity as well as stability. The wheels are 36 inches in diameter and both front and rear are fitted with 36 by 4.5-inch tires mounted on Continental demountable rims. The front axle is of the conventional I beam section type and the tierod is located in the rear. The wheelbase is 132 inches and the tread standard.

The driver is located at the left and the steering column is set at a comfortable angle, being surmounted by a large wheel with a corrugated rim. The spark and throttle levers are mounted on a sector. The usual accelerator is included.

Fuel is supplied by the pressure system, the tank being suspended at the rear of the chassis and having a capacity of 24 gallons. The proper pressure is maintained by a piston pump actuated by a cam on the camshaft of the motor. The cowl dash is well proportioned and back of this is the mahogany dash on which is mounted the electric meters and other control units.

Special attention has been paid to the upholstery, which includes a special mixture of hair 11 inches deep, covered with a high grade black leather. The tonneau of the touring body is very roomy and ample leg room is provided in the front. Access to the tonneau is by 21-inch doors, a dimension making for convenience.

The equipment leaves nothing to be desired. including as it does a Golde patented mohair top, which may be operated by one person; envelope, windshield, speedometer, shock absorbers, double tire irons, robe and foot rails, horn,

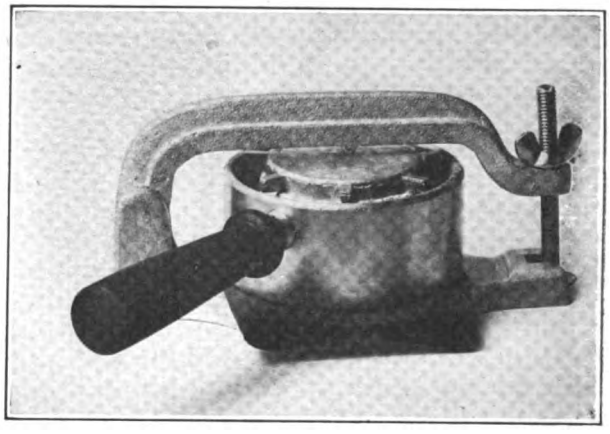
TIRE EQUIPMENT IS IMPORTANT.

Value of a Thorough Inspection of Shoes, Tubes and Rims---Accessories Making for Convenience and Economy---Hints on Maintenance.

IN THE preparation of the car for the tour the tire equipment should not be overlooked, and this applies to both the new and old machine. The

Illustrating the Essential Steps in Folding Inner Tubes Before Placing in the Tube Bag.



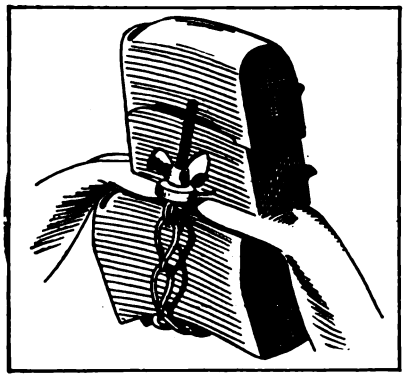
experienced tourist is not satisfied with purchasing and carrying spare casings and tubes, which the new motorist is apt to deem a sufficient precaution against trouble, but subjects the shoes in service to a thorough examination. This precaution is to be recommended as frequently an apparently good shoe may have broken fabric which cannot be determined from the exterior appearance of the casing. Reinforcing the damaged section not only prevents the blow-out, but is good tire insurance.

While it is admitted that it is a disagreeable task to remove and replace four tires, and that a large number of motorists delay this work until compelled to make a change, the results obtained from a thorough inspection of the casings will amply repay one for the labor involved. It also affords an excellent opportunity to inspect and clean the rims as well as to note if the retaining rings, locking nuts, etc., are in good condition.

Dealing first with the shoes on the car: They should be removed from the rims, carefully wiped out and the envelope opened to note if the fabric is sound. By bending the bead of each side outward it may be determined if there are any loose places in the fabric. If a place is found where the casing is very pliable and soft it is apt to denote that the fabric has begun to separate, and the shoe should be taken to the tire expert for his opinion as to its serviceability. It should be remembered that the fabric ought to be hard and firm. The separation of the plies referred to is generally due to the fact that the tires have been under-inflated, creating a weaving movement that rapidly destroys the construction.

Discolored fabric on the interior lining is indicative of a puncture which has permitted moisture to penetrate the plies and it is only a question of time when deterioration of the fabric takes place, and the blow-out occurs. What appear to be trifling cuts in the tread may be serious and the extent of the injury can only be determined by a very careful examination of the interior of the casing. All cuts should be vulcanized, although there are preparations marketed for mending the breaks if the owner prefers to do his own repairing. Unless one be familiar with the ills to which tires are subjected, it is best to carry the casings to the tire man and abide by his judgment.

The removal of the shoes affords an excellent opportunity to clean the rims. More or less rust or deposits will gather after considerable service and should be removed. The work may be performed by sandpaper or emery cloth, depending upon the nature of the deposits. After cleaning the metal, prepare a mixture of powdered graphite and oil, using enough of the latter to make a thick paste. Apply the mixture freely, after which remove the surplus with a cloth or piece of waste. A high polish can readily be imparted to



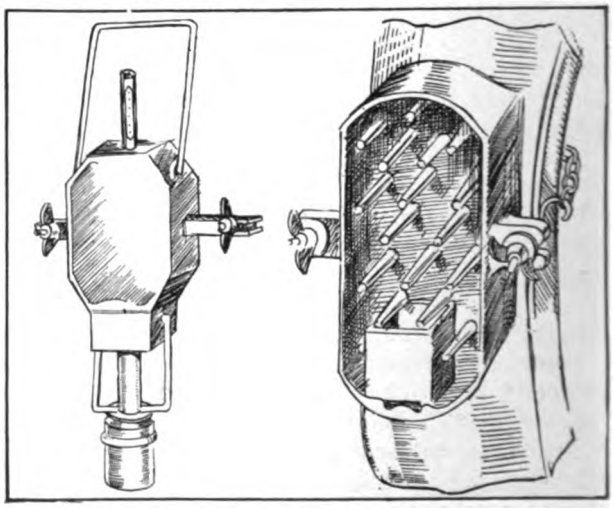
The Shaler Vul-Kit, a Moderately Priced Automatic Vulcanizer Employing Gasoline.

the metal and it is surprising how easy it is to change a shoe with graphited rims. The graphite will fill each pore of the metal and resist the ac-

Digitized by Google

tion of water, dirt and heat. The locking rims, nuts, bolts, etc., should be similarly treated. Those who do not care to use the graphite mixture can employ preparations marketed for this purpose, and some of these include graphite. While some advocate the use of shellac or paint, graphite or preparations including graphite are to be preferred as they do not increase the diameter. This may appear to be a very small factor, but in fitting a new shoe it is generally found to be an important one.

McVey Vulcanizer Using Gasoline.



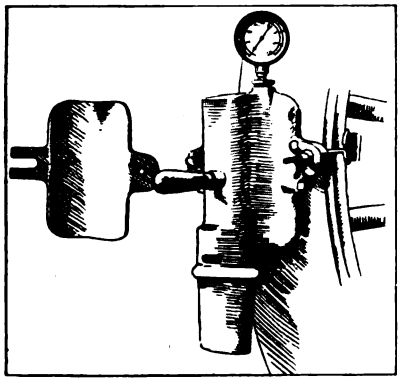
In replacing the shoes those in the best condition should be fitted to the front wheels; that is, if the same size is utilized all around. This will make for increased mileage. It also is a good plan to place those formerly on the right hand side of the machine on the left hand wheels, as it is estimated that the shoes on the right are subjected to more stresses than their mates.

The number of spares to be carried will depend on the condition of the present shoes, the contemplated mileage and the car. Some machines are very easy on tires and often exceed the mileage guaranteed by the maker. On the other hand, the car may be hard on tires. There are a number of conditions entering into the service of shoes which are not given consideration by all motorists. In spite of the fact that tire manufacturers spend large sums in endeavoring to educate the automobilist in the care of tires and the need for proper inflation, the advice is not followed. It is safe to predict that were 25 cars stopped on the road and the pressure taken of each 50 per cent. would not be found to be up to that recommended by the maker. This may appear to be a broad statement, but if one will note the rear tires of passing machines, it will be surprising how many will be seen to be slightly flattened where they contact with the road. The importance of proper tire inflation was dealt with in a recent issue of The Automobile Journal and it may be added that much more satisfaction will be derived when seeking an adjustment if the tire has been kept to proper pressure.

In the inspection of the tire equipment the inner tubes should not be overlooked. Doubtful members should be inflated and tested for leaks, and if the valves of any have been giving trouble, remove them, clean or fit new. The number of spare inner tubes required will depend largely on the car and the owner. Some make it a practise to carry but one, relying upon cement and patches, while others have six or eight. As the number of possible punctures is an unknown quantity, no rule can be laid down as to the proper extra tube equipment.

The care of the extra casings is important. The best plan is to employ covers, although the new tire is well protected by the wrappings from the factory. In mounting the extra members care should be exercised that the straps or holders do not chafe the rubber as it requires but a few miles of running under such conditions to remove a considerable amount of the rubber.

Inner tubes should not be exposed to the light, heat, oils or greases, or stowed carelessly. The best plan is to purchase a tube bag and these may be procured for a small sum. The proper method of folding inner tubes is shown in an accompanying illustration, the steps being alphabetically arranged. First remove the valve and fold the tube so as to allow the escape of the air as shown at A. Next roll as indicated at B, beginning with the end farthest from the valve. This will enable the displacement of the air, but it will be noted that some will accumulate at the end because of the bend. By moving the valve and rolling at the same time, all air may be displaced and the tube rolled as shown at E. The tube should be compressed to prevent air entering while the valve and cap are replaced. The



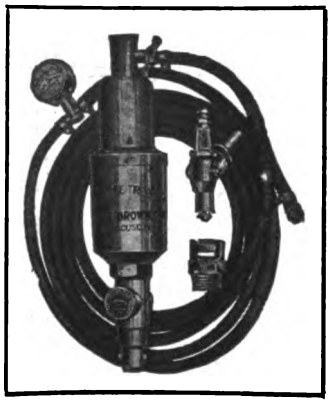
National Portable Steam Vulcanizer, Adapted for Both Tires and Inner Tubes, and the Mascot.

tube is now ready for the bag. Open the tube as shown at C, keeping the valve in the centre, and fold each end inward as illustrated at D, making

Digitized by Google

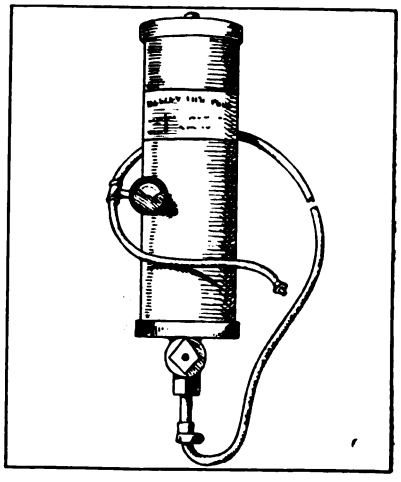
a final fold as at F. The result is a flat package. The folds may be secured by rubber bands and these may be made from an old inner tube. A small quantity of soapstone or talc in the bag is recommended.

Concerning the equipment: One should be very careful in the examination of the pump and if it has not been operating satisfactorily, it should be repaired or a new one purchased. It is optional as to type of patches to be carried, also the cement. Some make it a practise to include a blow-out patch and an outside sleeve in the equipment, but this is a question the owner must decide for himself. They take but little space and may prove of decided value. Every tourist should carry at least one pair of Weed tire chains, and some include two. These are invaluable in touring over wet and slippery roads as not only is skidding eliminated, but proper traction is provided. A few extra tire valves cost but a few cents and may save considerable pumping.



Van Steam Portable Vulcaniser.

There is no disputing the fact that inflating tires by hand on a warm day is a disagreeable task. This may be eliminated by the fitting of a power tire pump if the machine is not thus equipped. Power pumps are not expensive, are very compact and in the event of several punctures the driver is saved considerable exertion, as the motor does the work.

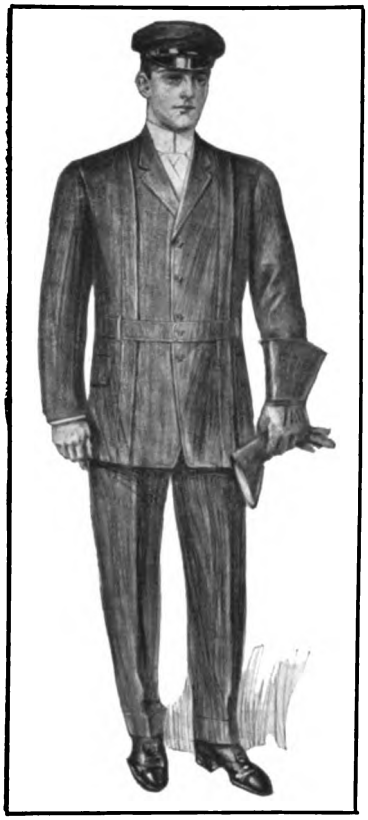


Among the makers of power tire pumps is the Dewey-Anderson Company, Toledo, O., manufacturer of the Dewey, which is shown in an accompanying illustration. It is constructed of high grade material and the workmanship is first class in every respect. It may be carried in the car or permanently fitted to the motor, as suits the convenience of the motorist. In the first named case a spark plug is removed from a cylinder and the pump inserted, an operation performed easily by the hands and without the aid of tools. The Dewey is but 12 inches high, weighs less than four pounds, and will inflate a shoe with pure, fresh air in a very short period. Suitable length of hose, pressure gauge, self-opening connections and a control member are included in the equipment.

Another illustration presents the Brown Impulse tire pump, which also is operated by the compression of the motor and may be used either as a permanent fixture or attached when desired. When fitted permanently a hole is tapped into the cylinder head and the pump operated in a horizontal position. Only fresh air is forced to the tire by the pump, which is constructed in a similar manner to a motor. The cyinders are made of gray iron, bored and reamed to exact size, and it is held that the pump requires no attention after installation. The outfit includes 12 feet of flexible hose, pressure gauge and control member. It is manufactured by the Brown Company, Syracuse, N. Y.

Brown Impulse Tire Pump.

There are a number of high grade, moderately priced vulcanizers of the portable type which may be carried easily in the car, and by including one in the equipment it is possible to complete repairs to inner tubes and shoes while en route. The use of these devices does not require a knowledge of the process of curing rubber, as the vulcanizers are entirely automatic in their work. They are made in several forms and employ gasoline for obtaining the necessary heat for curing. By pouring a predetermined quantity of the fuel in the receptacle provided for the purpose, and lighting it, the proper curing temperature is obtained. Some types are so designed that cuts in the tread of a shoe may be vulcanized without removing the casing from the wheel. The equipment invariably includes all material necessary to complete a repair, and a large number of vulcanizations can be made from a conventional outfit. Individual opinion differs as to the tire repair kit and this is a problem that is best solved by the owner.



Dewey Power Tire Pump.

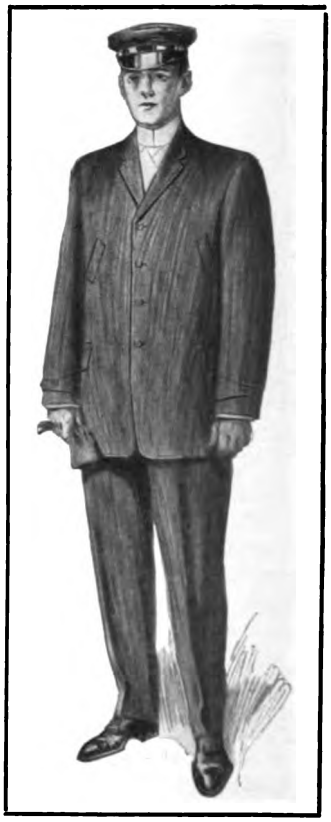
PRACTICAL GARMENTS FOR MOTOR TOURING.

Suggestions for the Man Who Desires to Be Well Dressed While on the Road—Protection for the Clothing When at Work About the Car, Etc.

IN UNDERTAKING long tours, especially, the motorist desires to be equipped for every emergency. This applies quite as forcibly to the subject of clothing, as to the matter of extra tires, for instance, and while ordinarily this contains more of interest to the women of the party, practically no man plans a tour covering any considerable distance without giving the question consideration. And no matter whether the trip is to occupy two or three days, or takes on the aspect of a transcontinental journey, the possibilities are many.



The Norfolk Is One of the Most Popular Models.

Naturally, the man who drives his own car must provide for a greater number of contingencies than he who employs a chauffeur. The latter may feel that he is well equipped if he has with him sufficient garments to protect him from the rain, the dust and the cold. The former, since he combines the duties of the chauffeur with those of pleasure or recreation, needs a somewhat larger wardrobe. But in either instance, it is not wise to carry too much for several reasons.

First of all, the tourist requires a good serviceable suit, one which will present real wearing qualities and which can be worn upon almost any occasion without attracting unfavorable comment. It must be remembered that when touring in the mountains, for instance, it is quite possible that one will meet friends at the night stop, with whom it is desired to spend the evening in a social way. It hardly can be expected that a motorist will at all times be prepared with a dinner coat, but the thoughtful man will dislike to give offense by appearing in a suit that bears unmistakable evidence of the road.

It should not be considered at all necessary for the man who drives his own car to purchase an expensive suit for a trip of this character, and it will be found that in most cities it is possible to make a most satisfactory selection from the stock of ready made goods carried by the local merchant. Some men are accustomed to pay more for their clothing than others, but usually the motorist confines himself to a figure ranging between $18 and $35 for a touring suit. This depends largely upon the man and his position in life.

Perhaps one of the most popular models this season is the Norfolk, either with a belt completely around the waist or with a short belt in the back, patch pockets or pockets giving this effect, and a turn-down notch collar or a soft rolling collar. At the prices quoted above it is possible to secure this model in cheviot, homespun or tweed, and the prevailing colors are blue or the lighter shades. For those who prefer, the single-breasted sack suit with notch collar and vertical breast pockets is considered quite as desirable in every respect.

The Single-Breasted Sack Suit Also Finds Favor.

As a protection against ordinary road dust and dirt, nothing has been found to equal the linen duster. It is light in weight, durable and readily washed when soiled. The prices range all

Digitized by Google

The Duster Comes in Many Styles and Fabrics.

the way from $1.50 to $35, although for every practical purpose one which costs about $5 or $6 is held to be as serviceable as any. Among the newer models is that which is supplied with a convertable collar, permitting of buttoning closely about the neck, although it may be worn open at the throat if desired, in which event it presents the appearance of the ordinary turned-down collar.

When touring in the mountains, or in the early evening, almost throughout the season, it is found desirable to have a somewhat heavier coat. This applies particularly to the man who is not driving. And in this line there is a wide opportunity for selection.

The Gabardine model is new and is meeting with decided favor. It is made of an English material, closely woven and cravenetted. The color is usually tan or olive, and the price ranges from $15 to $25. The coat may be considered light in weight, although somewhat heavier than the linen duster, and might be used in place of the latter if desired.

The Oxford is made of worsted and comes with and without the convertible collar mentioned previously. This is still heavier than the Gabardine, but not quite as heavy as the tweeds, which are utilized for what may be considered an overcoat model. Both of these may be had at prices ranging from $20 to $50.

The Mackinaw has enjoyed wide popularity on both sides of the Atlantic for the past year. It is of heavy material, and it is maintained that it will not wet through even after a long drive in the rain. The prices are from $7.50 to $12.50, and the garment may be regarded as exceedingly practical in every way.

In the longer automobile coats there is what is termed the Regent Street model, with full skirt and sleeves, but with shoulders very narrow. Another imported model is with raglan shoulder, Prussian military collar and a full sweep to the skirt. These are both furnished in tweed. Then there is a garment of English army cloth, with a belted back and so-called bell bottom sweep of 86 inches. It may be stated that the full skirt is quite noticeable in all of this year's models.

While it has been stated that the Mackinaw is regarded as capable of protecting the wearer against rain under most unfavorable circumstances, there are many who will desire to place dependence upon the rubberized coat. There is a wide variety from which to make selection, the prices being almost anything from $3.50 up.

Perhaps some mention should be made of special suits applicable for touring in the South or in the hottest part of the season, and with these the list includes two-piece suits from $4 to $30, the materials being linen, flannel, mohairs, khaki, etc. These come in both the Norfolk and plain sack coat models, and, of course, only in the lighter shades.

In the matter of caps, it usually will be found that these match the suit. Sometimes it is possible to secure a cap that is made of the same material as well as shade. There are several styles, among the most popular being the Crackerjack with a band around the side, the tietop with ribbon flaps tied at the top and the golf shapes. Some drivers prefer the stiff visor cap, which is favored very largely for chauffeurs.

No attempt has been made herein to differentiate between the man who drives his own car and the man who employs a chauffeur, for the reason that many of the models mentioned are considered

Double-Breasted Ulster with Military Collar.

Digitized by Google

Alligator Long Coat Buttoning in Front.

quite as applicable to each. Those who are interested in providing quite the proper thing for the chauffeur will find that the Norfolk suit is very popular here as well, although it is more often worn with the yoke buttoned to the neck and a military collar. It is permitted that the chauffeur may wear either long trousers or breeches and leather leggins. Among the newer importations is an English leggin, closed at the top with a spring and strap.

The man who finds it necessary to make repairs on the road requires a combination overalls and jumper, which covers him completely from head to foot. The market affords a number of designs, but perhaps one of the most practical of these is the Fast Limited, made by the Detroit Overall Company, Detroit. This is a one-piece garment of heavy pin check denim, which is closed tightly at the neck and wrists, and being of light weight makes for decided comfort. There are four large pockets, in which tools may be kept, and the whole garment is made with deep, continuous sides, relieving the shoulders from all strain and affording complete protection in any position.

There is also the chauffeur's auto-shirt, so-called, which is made of rubber. The garment slips on over the head and completely envelopes the wearer, being designed to protect from the rain, as well as from dirt, etc., when making repairs. Still another design of a similar nature, although intended only for protection from rain, is the rubber auto-coat, with double fly buttoning across the chest.

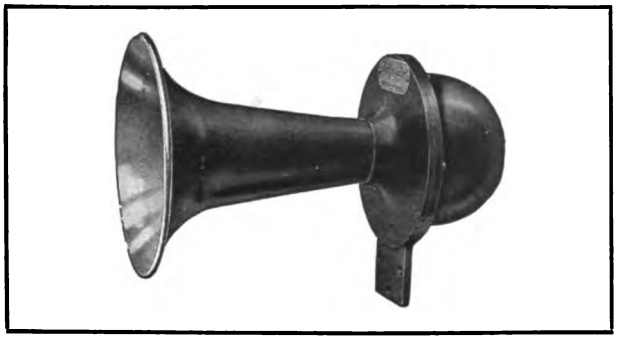
Another Alligator Model of Water Proof Material.

Among the specially designed rubber motoring coats are those bearing the Alligator trade mark, made by the Ferguson Waterproof Company, St. Louis, Mo. Two of these models are shown herewith, one of them being made to button entirely down the front and the other opening only at the throat and slipping on somewhat like the auto-shirt previously mentioned. The latter is fitted with draw strings at the wrist so as to protect the wearer fully. These come in army drab and black, and the material is soft, pliant, tough and leathery after wearing. It is stated by the maker that oil and gasoline do not hurt them and that they improve with age.

Obviously, it would be impossible in the limited space available to enumerate all the garments designed for automobile wear, and it is unnecessary to do more than make mention of gloves, goggles and other articles of this nature. It may be added, however, that the line of gloves offered includes those of colt's skin and suede, with lisle backs and cape arms.

Rubber Auto-Coat Buttoning Across the Chest.

Except where credit is given otherwise The Automobile Journal is indebted to Filene's of Boston for the description of the various models presented, and to Browning, King & Co. of New York City, with branches in Chicago, St. Louis, Milwaukee, Cleveland, Cincinnati, Buffalo, Boston, Philadelphia, Providence, Kansas City, St. Paul, Minneapolis and Omaha, for the cuts illustrating this article.



THE REACTO HORN.

Holtzer-Cabot Electric Company Marketing an Efficient Electrical Unit.

The Holtzer-Cabot Electric Company, Chicago and Boston, is marketing an electric horn

Digitized by Google

which has a clear and penetrating, but not harsh tone. Although the Reacto signalling horn is moderately priced, it is constructed of high grade

Reacto Electric Horn of the Single-Blow Hammer Type and Having a Penetrating but Not Harsh Tone.

material and with the care for which the products of this company are noted. It is of the simple hammer blow type, a construction that secures a direct application of the power to the diaphragm and consequently instantaneous response, preventing rasping or discord in the sound produced.

One of the features of the horn is that it will respond to battery voltages 25 per cent. below normal and therefore does not require adjustment. Means are provided, however, for changing the tone. Sparking between the heavy platinum contact points is prevented by the use of a well designed condenser, which also serves to improve the tone. The casing and projector are of the best material and of the proper weight. The entire construction is sturdy.

The rear casing may be removed easily when connecting in circuit by displacing the retaining screws. The standard finish is japan, baked on, with nickel throat, but it is also finished with polished brass throat or in full nickel or brass. The Reacto horn is designed to meet the requirements of motorists desiring a strictly high grade signal, one having a pleasing tone, and capable of maximum service without attention. With the normal six-volt adjustment it will operate throughout a range from 4.5 to eight volts. The company also manufactures Reacto horns for any specified voltage from four to 125, thus adapting them for electric pleasure and commercial vehicles and factories, as well as gasoline automobiles.

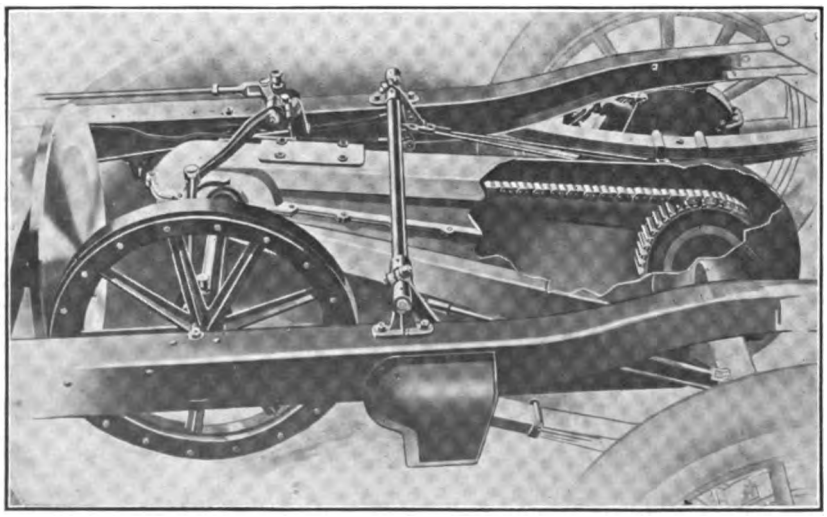
EDISON IGNITION BATTERY.

New Type Adapted for Lighting as Well, and Developed from Traction Unit.

In perfecting his storage battery for electric trucks and pleasure cars, Mr. Edison incidentally produced a battery that is ideal for ignition and lighting. Before it was put on the market the traction battery was made to withstand the following tests: To be dropped on a solid block from a height of .5 or .75 inch for 2,000,000 consecutive times and have as great an electrical capacity as before the tests; to be afterwards secured to a truck, longitudinally, and the truck projected against a stone wall 500 times at a speed of 15 miles an hour at moment of impact; to be then placed laterally across the truck and the 500 impacts repeated. When a type of cell that would stand this treatment was finally produced the Edison Storage Battery Company of Orange, N. J., started business.

The ignition and lighting cells are practically the same general type as the larger used for traction. The receptacles for the active materials are held in steel grids about one-half as high as in the traction cells, but in other respects the manufacture of the two types is nearly identical. The elements are nickel hydrate and iron oxide with an alkaline electrolyte, potassium hydrate solution. There is claimed to be no chemical action, therefore, when the cell is standing idle—either charged or discharged—so that the cars using Edison storage batteries can be laid up or stored for months without affecting the battery. The container is made of nickel plated steel, like the grids, poles and all other parts, except the actual active material and insulation, and is held to be absolutely unbreakable. The cells will stand, without injury, continuous charging indefinitely,

Eighty Ampere-Hour Edison Ignition and Lighting Battery.



dead short circuiting, charging at several times the normal rate and practically all the errors and misuse to which "battery troubles" are traceable.

Digitized by Google

FEATURES OF CARTERCAR TRANSMISSION.

CARTERCARS, produced by the Cartercar Company, Pontiac, Mich., comprise one chassis known as the model 5, to which is fitted five styles of bodies. These comprise the 5 A, a five-passenger touring; 5 B, a two-passenger roadster; 5 C, a three-passenger coupe, and 5 D, a five-passenger sedan. These models contain many refinements and conveniences, including electric lighting and starting, and the equipment is very complete.

The power plant is practically the same as that utilized with the model R chassis with the exception that the motor is constructed higher and more narrow, providing considerable more room under the hood, as well as giving a neater appearance. The four cylinders are of the L head type, cast in pairs, and have a bore of 4.125 inches and stroke of 4.75. The valves are ample in size, enclosed and very accessible. Throughout the material and workmanship of the motor is in keeping with the policy of the company to produce a strictly high grade engine capable of giving maximum service with a minimum of care.

Sectional View of Chain in Oil Drive Used in Cartercar Model 5—The Simplicity of the Friction Drive Is Also Shown.

Cooling is by a centrifugal, direct driven pump, which with the ample capacity radiator and large water jackets insures proper motor temperature under all conditions of service. Ignition is by a dual, low-tension magneto with an auxiliary system consisting of a battery and a single non-vibrating coil. The carburetor is an automatic float feed type. The lubrication system is held to be very efficient and economical of oil. It is of the splash type, a constant level being maintained by a positive plunger pump which provides an equal supply to each cylinder. The lower crankcase is divided into compartments, insuring a proper supply of lubricant, irrespective of grades. A sight feed glass, through which the lubricant is forced, enables the driver to regulate the supply to suit conditions.

The transmission is the well known Cartercar friction which has proven its economy and efficiency under the severest conditions of service. The practicability of the principle has long been established by sound engineering practise, and tests have demonstrated its ability to transmit the maximum power of motor with a minimum loss of energy.

The simplicity of the transmission is shown in an accompanying illustration, and it will be noted that there are but two unit parts, a friction disc and a fibre faced wheel. The former is composed of a heavy ribbed casting or plate, and a facing plate of a special metal alloy. The disc is secured directly to the end of the drive shaft and is practically integral with it. The driven, fibre faced wheel contacts with the plate wheel, and the combination of the materials utilized affords the utmost cohesion as the two roll together.

The moving of the disc across the face of the driving member provides an indefinite number of speeds, forward or reverse, permitting anything from a pace slower than one can walk to the maximum. Control is by a pedal and lever, the former breaking the contact, while the lever is utilized in moving the driven disc to any desired position. Changes are made without noise and the maker points out that the transmission is particularly adapted to traffic where stopping and changing of speeds are necessary. Another advantage afforded by the transmission is that the car may be started easily and slowly, thereby effecting tire economy.

Final drive is by silent chain, enclosed and operating in a bath of oil. The chain has triangular shaped links which mesh perfectly in the teeth of the sprockets which are two inches wide. The links are treated by a special hardening process, are very durable, and it is stated that the

Digitized by Google

chain is free from stretching or wearing loose on the sprockets. Both driving and driven discs are readily accessible, as is the silent chain and sprockets. It is pointed out that these components make for maximum service.

The frame is of pressed steel with channel construction of great strength and rigidity, of the single drop pattern and a patented rear cross member suspension. The springs are semi-elliptic in front and three-quarter scroll elliptic in rear. The wheelbase is 116 inches. The front axle is a drop forging, of the I beam section type, and the yokes, tierod ends and steering knuckles are drop forged, insuring a large factor of safety. The rear axle is of the three-quarter floating type with removable shafts. The differential is a bevel gear, and the gear ratio or drive is 3.6:1. The wheels are artillery, 10 spokes in front and 12 in the rear and are equipped with demountable rims and shod with 36 by four-inch tires. One extra rim is standard equipment.

The brakes of the Cartercar are ample in size and very efficient. The service members are of the external contracting type on the rear wheels and are actuated by pedal. The emergency set is internal expanding, operated by the conventional lever. The steering gear is of the worm and nut, irreversible type, and provision is made for the elimination of play or wear. The steering column is set at a comfortable angle and is surmounted by an 18-inch walnut wheel. The spark and throttle levers are located on a sector on the wheel, and throughout the steering mechanism is noticeable for its sturdy construction.

The various types of bodies fitted to the Cartercar chassis are very neat and well designed, having straight lines and fenders that harmonize with the designs. The seats are roomy and there is ample room both in the tonneau and front. The springs are of the double deck type and the seats and backs are upholstered with a high grade leather and include the best curled hair. The finish is in keeping with the other high grade construction, there being 25 processes, including 15 coats of varnish and paint. The colors include raven blue, French gray and black—quiet colors, yet having enough variety to please the most particular. Nickel plate and black enamel trimmings are employed throughout.

The equipment is very complete and includes in addition to electric lighting and motor starting, a mohair top, curtains, envelope, ventilating windshield, speedometer, horn, robe and foot rails, tire irons, trunk rack, rebound straps, tire pump, tire repair kit and a full set of tools.

FOUR VS. SIX-CYLINDER CARS.

President of Mercer Automobile Company Discusses Present Situation.

It will be remembered that about a year ago it was freely predicted that the season of 1913 was to be a six-cylinder year. The machines on view at the various shows last winter failed to bear out this assertion entirely, although the number of new sixes was noticeably large. The following discussion of the subject is from the pen of William T. White, president and general manager of the Mercer Automobile Company, Trenton, N. J., maker of Mercer cars:

It is our confident belief that the popularity of six-cylinder cars is gradually on the wane, and that before many months four-cylinder cars will again be in greater favor than they ever were before. This belief is borne out by the fact that buyers of the current season are extremely painstaking in determining the weight, fuel consumption, tire mileage and general upkeep expense of the car they contemplate buying.

This condition is quite largely the result of the rapid rise in the price of gasoline. The average motorist can very easily see the folly of using a six-cylinder car and getting only about seven or eight miles to the gallon of gasoline, when he can secure a high grade medium weight four-cylinder car that will average 12 to 14 miles to a gallon of fuel. Coupled with the excessive use of gasoline in a six-cylinder car he has tire and general upkeep expense that are almost out of reason, owing to the extra weight.

It has always been claimed for the six-cylinder car that it is superior to the four because of its efficiency and flexibility. This may be true so far as the comparison with some four-cylinder cars is concerned, but the Mercer Automobile Company has been very successful in its manufacture of four-cylinder cars, and anyone who will take the trouble to investigate will find that it would be very difficult indeed to find a six-cylinder motor capable of showing greater efficiency, flexibility, silence, or smoother operation than the Mercer motor. As for speed, it is a well known fact that no speed records of any consequence have ever been made with anything but four-cylinder cars.

Europe has always been a fairly good barometer of the trend of automobile conditions, and it has been observed that already the French and English makers are reverting to fours after several years of very strenuous six-cylinder activity. Over on the other side the four-cylinder motor is unquestionably now recognized as the standard car, and the six is slowly but surely being rejected.

It is true there will always be six-cylinder advocates, and plenty of buyers who will have nothing but sixes, but the present outlook indicates most clearly that four-cylinder cars are again coming into popular favor.

It will be noticed that the trend of design in both Europe and the United States is toward the motor that has a bore not larger than 4.5 inches and is capable of very high speed, some attaining 3000 revolutions a minute, and developing much greater horsepower than the old motors of larger bore or the newer motors having six cylinders.

The G. H. A. Goodwin Company, Los Angeles, Cal., reports having leased for J. Hartley Taylor to the Homer Motors Company, two acres of land on the San Fernando road, just beyond Elysian park, in the new industrial district, on the lines of the Salt Lake & Southern Pacific railroad. This company proposes to engage in the manufacture of automobiles and traction engines.

KEETON IN SOUTH AMERICA.

Detroit Concern Establishes Connection in Argentine Republic.

In an effort to secure its full share of the automobile business in South America, the Keeton Motor Company, Detroit, maker of Keeton cars, has closed an agency proposition with William H. Knox & Co., of the River Platte Agency, Rivadavia 1385, Buenos Aires, Argentine Republic. This concern maintains an office in the White Hall building, New York City, from which point three fully equipped 1914 models have been shipped to Argentine.

The Knox company is a leading concern in South America and has been doing a splendid business in automobiles in that country. P. F. Rockett of Buenos Aires, who is regarded as an expert on motor car sales in that country, and who is a firm believer in the possibilities for the American manufacturer providing reputable dealers are appointed to handle the product in South America, speaks very highly of this concern.

A. B. Hambleton, Cleveland, O., 84 Years of Age, at Wheel of White Car.

NEW KISSELKAR LINE.

Will Include Three Chassis, Two Sixes and a Four-Cylinder.

The new series of KisselKar pleasure cars will consist of three chassis models, a four-cylinder 40 horsepower, a 6-48 and a 6-60. This eliminates from the line the "Thirty" and "Fifty," both four-cylinder types, heretofore built by the Kissel Motor Car Company of Hartford, Wis. Only details of the 6-48 are announced, a description of the new design appearing elsewhere in this issue. The new car is manufactured at the auxiliary plant of the company at Milwaukee, Wis. The other designs will be produced at the main factory in Hartford.

AN OCTOGENARIAN TOURIST.

A. B. Hambleton of Cleveland to Visit New York City and Cape Cod.

Not many men of 80 years have the inclination to drive motor cars, to say nothing of planning and accomplishing long distance tours, but A. B. Hambleton, who lives at Shaker Heights, Cleveland, O., is 84 years of age and drives a new 30 horsepower White car, made by the White company of that city. In fact, Mr. Hambleton is a long distance tourist of some note, and he intends to pilot this machine on a tour to New York City and Cape Cod this month.

Mr. Hambleton has been driving motor cars for eight years and in that period he has made a number of journeys that would be notable even if made by a Glidden tour enthusiast. A little run to New York and back is a mere incident in his motoring career, while he regards a trip to Buffalo and return with no more concern than the routine of driving down town. He takes care of his own car for the amusement he derives therefrom.

On this present tour there will be no chauffeur in the car. In his eight years' experience Mr. Hambleton has suffered but one accident, which occurred while cranking, resulting in a broken wrist. In purchasing his latest machine he selected a White because he was favorably impressed with the simplicity and efficiency of its electrical system of starting and lighting. Although he is now retired, he has had wide experience along mechanical lines, having been instrumental in building up the Globe Iron Works, now the American Shipbuilding Company, which makes engines among other things.

Bert Dingley, in a National racing car, made by the National Motor Vehicle Company, Indianapolis, Ind., recently created a new record between Modesto and Stockton, Cal., covering the 30 miles in 29 minutes.

MULFORD WINS AT COLUMBUS.

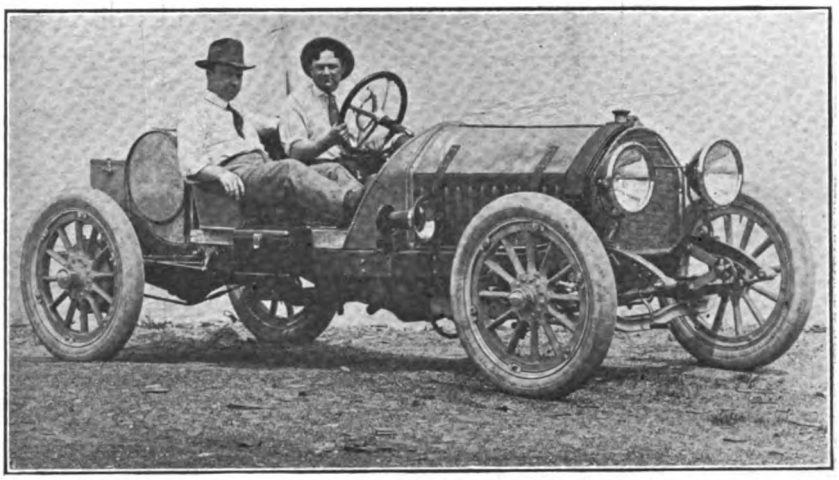
Takes 200-Mile Event on Dirt Track with Mason, Creating New Record.

According to unofficial reports from Columbus, O., this year's 200-mile dirt track race, which took place July 4, was won by Ralph Mulford in a Mason car, his time for the distance being 3:21:48. Last year's event was won by Spencer E. Wishart in a Mercer, creating a new record for the distance of 3:28:04.5. It would appear that Mulford secured a new. mark. Harry Endicott in a Nyberg was second in 3:45:34.55; Ernest Reeder in a Mercer third in 3:47:53.65, and Ralph DePalma in another Mercer fourth in 4:00:42.61.

There were 16 entrants, the others including E. V. Rickenbacher, Mason; John Jenkins, Schacht; William Fritsch, Cino; Lewis Meneghetti, Fiat; John Raimey, Ohio; Harry Matthews, Ohio; N. E. Walker, Garford; F. L. Adams, Smada; Joseph Horan, Lozier, and Harry Knight in a front-wheel driven machine. The contest was marred by the death of Knight, who had been out of the race because of necessary repairs for 39 minutes and was making every effort to regain a place in the field when his car overturned on the 110th lap. McCallis, the mechanician, also was fatally injured and died later in the day. Knight began his driving career when 13 years of age, being the first to take a car cross country from his home in Indianapolis to Washington, D. C., and had been prominent in all the Glidden tours, as well as many racing events.

VERBECK IN CALIFORNIA.

Assisted by Willeford He Takes the Panama-Pacific Race with Fiat Car.



Forty-six cars were entered for the Panama-Pacific road race from Los Angeles to Sacramento, Cal., July 4, the distance being 444 miles. Frank Verbeck and C. C. Willeford, driving a Fiat car, took the event in 11:01:16. E. S. Waterman and Clifford Perry in a Buick were second in 11:21:25, while Barney Oldfield at the wheel of a Mercer was third in 11:22:53.

Verbeck's Fiat was entered by E. E. Hewlitt, and as true of all racing cars owned by Mr. Hewlitt, was fitted with Miller tires, made by the Miller Rubber Company, Akron, O. A telegram has been received by the Miller company assuring it that the performance of its tires were the feature of the event.

AROUND LAKE MICHIGAN.

Fourteen Entries for Chicago Event Still Two Months Distant.

Although the annual tour around Lake Michigan, held by the Chicago Motor Club, is not scheduled until Sept. 8, 14 entries already have been received, as follows: Z. Elkin, Rambler; P. E. Ennis, Marmon; R. Wolfe, Henderson; T. Hay, Staver; H. Staver, Staver; B. Sykes, Paige; C. Anderson, Stutz; A. A. Landry, Marion; M. J. Kavanaugh, Midland; M. C. Meigs, Case; A. M. Robbins, Abbott-Detroit; W. E. Stainaker, Premier; F. C. Lewin, Chadwick, and Foraker Motor Truck Company, Bessemer truck. The tentative route follows:

O. W. Kern at the Wheel of the KisselKar Which He Drove in Los Angeles-Sacramento Road Race, July 4.

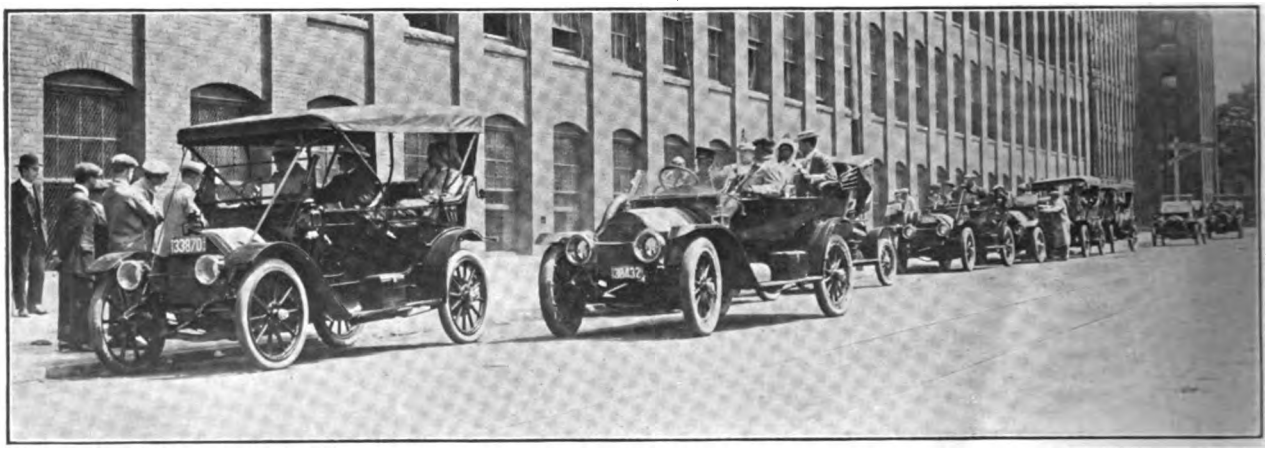
Chicago to	Noon Control	Miles
Green Bay, Wis.	Meeker, Wis.	225.0
Marquette, Mich.	Iron Mt., Wis.	221.9
Newberry, Mich.	Escanaba, Mich.	197.3
Petoskey, Mich.	Mackinaw, Mich.	103.3
Muskegon, Mich.	Manistee, Mich.	230.1
Chicago, Ill.	Dowagiac, Mich.	262.4
Total miles		1240.0

Louis Disbrow, driving his Simplex "Zip," created a new world's dirt track record for 12 miles at the Fourth of July meet in Sioux City, Ia., covering the distance in 9:20.8. He also won the 48-mile event, his time being 40:11.

Digitized by Google

GASOLINE ECONOMY CONTEST.

One of the Interesting Features of the Annual Run in Springfield, Mass.



The annual run and clambake of the Automobile Club of Springfield, Mass., last month, was of more than local interest because of the added feature, in the nature of a fuel economy test. The run itself was over a course covering some 30 miles, with secret controls, the winner of the Fiske cup being the driver who came the nearest to a predetermined schedule. The fortunate driver was Henry Cave, who took the award last year.

The object of the fuel test was not so much to determine an accurate rating of the machines entered as to afford an interesting comparison for the use of the members themselves, as to the efficiency of their cars. The method adopted for measuring the gasoline was by a pump cylinder such as is utilized on a standard portable measuring tank, together with a suitable measuring scale. All contestants were instructed to bring their cars to the contest with tanks practically full, the slight amount used up in arriving at the starting point being filled when the car was weighed in. A small metal bob was inserted in each tank and the tank filled up even with the filling hole, after which the bob was removed, giving sufficient displacement so that the fuel would not slop over.

At the end of the run the tanks were again filled and the amount put in carefully measured, affording the basis of computing the gasoline economy of the car. In order to give the fairest possible result, the figures were computed on the basis of 1000 pounds of actual car weight with passengers, rather than on merely the miles a gallon which were made by each individual machine.

The showing made by the local Knox machines was particularly striking, being such as to indicate the relative economy of the larger type of cars. A Knox six-cylinder touring car carrying three people made the highest showing of any of the water-cooled cars, while the eight Knox cars averaged over 16 miles to the gallon, or about 71 miles to the gallon on the 1000-pound basis. The score follows:

Car and Driver	Weight	Pass.	Mileage
Franklin, W. F. Anderson	3750	4	108.6
Knox, H. G. Farr	5135	3	106.0
Knox, F. E. Muzzy	4655	5	85.8
Knox, C. E. Alstrom	4665	5	83.6
Oldsmobile, F. E. Ward	4025	4	71.6

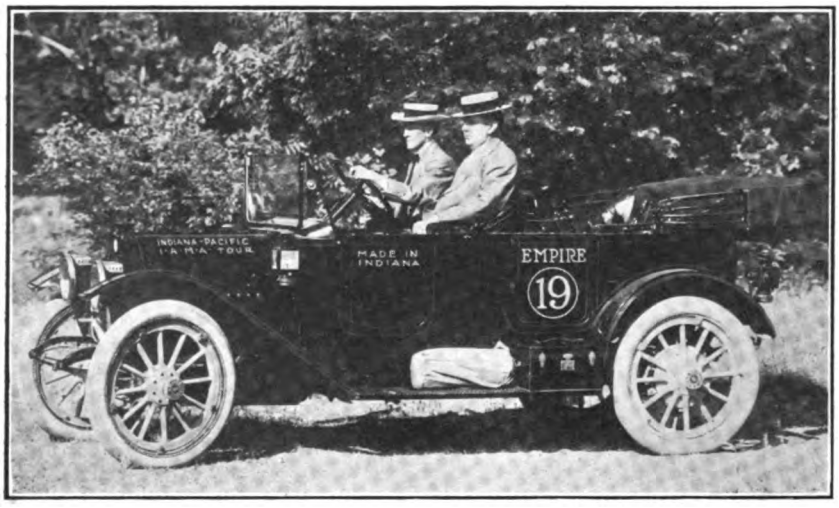
INDIANA MAKERS OFF TO THE COAST.

Twenty-Two Cars Leave Indianapolis for the Long Drive Over the Proposed Lincoln Highway—Contest Assumes Proportions of National Importance.

WHEN the Indiana Automobile Manufacturers' Association adopted the suggestion of Carl J. Fisher of Indianapolis that the Four-States tours of former years be extended in 1913 to embrace a transcontinental trip from Indianapolis to the Pacific Coast, it could by no means have been foreseen that this was to be one of the most important undertakings in the motor car industry. The tourists left Indianapolis July 1 and are scheduled to be in San Francisco July 27, and Los Angeles Aug. 2. Obviously, the entire story of the tour cannot be written until after the latter date, and in the strictest sense of the word it undoubtedly will be many years before the complete history of the whole enterprise shall have been recorded in all its details.

Competing Cars in the Indiana Automobile Manufacturers' Association Transcontinental Tour Lined up for the Start in Indianapolis.



It was shortly after the completion of the 1912 tour that Mr. Fisher made his suggestion, which at that time was considered somewhat premature. While it is true that a large number of parties had made transcontinental trips from ocean to ocean, notably that of the Premier tourists in 1911, the added features of a run of this character participated in by manufacturers of competing machines seemed to involve problems by no means easy of solution.

In the meantime, Mr. Fisher began to interest motorists and others in the construction of a permanent national highway, to be built by popular subscription and to be known as the Coast-to-Coast rock highway. It was estimated that the cost of this project would reach $10,000,000, and an organization was formed to secure the necessary funds. So successful was this enterprise that last month articles of incorporation were issued by the secretary of state at Lansing, Mich., to the Lincoln Highway Association, and the name of the road was changed to the Lincoln highway, in memory of the martyred President.

As an indication of the national character of this body, it may be noted that the association has established permanent headquarters in the Dime Bank building, Detroit, and has elected the following officers: President, Henry B. Joy, Detroit; vice presidents, Carl G. Fisher, Indianapolis, and A. R. Pardington, New York City; treasurer, Emory W. Clark, Detroit; secretary, A. R. Pardington. Including these officers, the executive committee and directors comprise Paul H. Deming, Cleveland; Russell A. Alger, Detroit; Roy D. Chapin, Detroit; A. Y. Gowen, Cleveland, and F. A. Seiberling, Akron, O. It ought also to be said that $4,200,000 of the necessary $10,000,000 has been subscribed.

As a further indication of the national importance of the enterprise, it is announced that A. L. Westgard, particularly well known as a pathfinder for the American Automobile Association, is participating in the tour, unofficially, as a representative of the National Highways Association,

Digitized by Google

The Empire 19, the Smallest Car in the Transcontinental Tour.

which body is interested in a system of national highways covering the entire country. It is understood that Mr. Westgard will represent this association exclusively in the future.

Mr. Fisher, who is prominently identified with the Indianapolis motor speedway, as well as with a number of Indianapolis plants in the industry, was active in the organization of the Indiana Automobile Manufacturers' Association. These tours were inaugurated by this association for the purpose of directing attention to the products of the industry in that state, and they have been decidedly successful.

This year's tour was organized for that purpose, and the purpose will by no means be entirely lost to view, in spite of the other factors which have entered since its inception. But all efforts will be made throughout the journey to interest the general public in the Lincoln highway, these including numerous banquets and talks at various points along the way, with full opportunity to subscribe to the fund and become members of the Lincoln Highway Association.

That the members of the Indiana Automobile Manufacturers' Association are willing to submerge their interests, at least partially, in order to aid in this larger undertaking, is but another example of the broad-mindedness of the men comprising the motor car industry. And it will in no way reflect upon the success of the tour from a publicity standpoint. The work of the Indiana made cars will be watched with increased interest, because of the enlarged scope of the contest.

There were 22 cars in the party when the start was made from Indianapolis July 1, the makers and drivers being as follows: American 1 and 2, American Motors Company, Indianapolis, Ind., D. S. Menasco and Charles Boyden; Henderson 3 and 4, Henderson Motor Car Company, Indianapolis, R. P. Henderson and Ray Harroun; Stutz 5 and 6, Ideal Motor Car Company, Indianapolis, H. C. Stutz; Marion 7 and 8, Marion Motor Car Company, Indianapolis, W. McK. White and E. G. Gager; Premier 9 and 10, Premier Motor Manufacturing Company, Indianapolis, John B. Orman and Ray McNamara; Haynes 12 and 13, Haynes Automobile Company, Kokomo, R. C. Crawford and Elwood Haynes; Pathfinder 14, Motor Car Manufacturing Company, Indianapolis, Bruce Daniels; McFarlan, 16, McFarlan Motor Car Company, Connersville, A. H. McFarlan; Apperson 17 and 18, Apperson Bros. Automobile Company, Kokomo, Elmer Apperson and Edgar Apperson; Empire 19, Empire Automobile Company, Indianapolis, Harlow Hyde; Pilot 20 and 21, Pilot Motor Car Company, Richmond, G. Fred Smith and Russell Gear; Marmon 22, Nordyke & Marmon Company, Indianapolis, C. G. Fisher. This does not include the G & J tire truck, driven by J. M. Ward. The membership of the party totalled about 70.

The cars were parked on New York street at 9:30 in the morning. An official luncheon, attended by the governor, mayor of Indianapolis.

Ray Harroun at the Wheel of the Henderson, Utilizing Kerosene.

Digitized by Google

29th Street, Norwood, Birmingham, Ala. Road built with "TARVIA X".

The Modern Road Binder

PLAIN macadam roads are adapted to slow horse-drawn traffic. Modern traffic, with its high speed, disintegrates and destroys the ordinary macadam. Its mineral binder cannot resist the thrusts of a driving wheel.

Roads adequate for modern traffic must be bonded with something adhesive, ductile and resisting. Such a binder is Tarvia, a specially prepared coal tar compound which retains its good qualities through all weathers and seasons and holds the stone firmly in place resisting all classes of modern traffic.

Tarvia is made in three grades:—"Tarvia X" is a very dense material to use as a binder in the large voids of new construction; "Tarvia A" is of thinner consistency for surfacing operations; "Tarvia B" is used cold, can be applied from a sprinkling cart and is sufficiently limpid to percolate into the pores of an old and well compacted road.

"Tarvia X" is required where new construction is called for. "Tarvia A" and "Tarvia B" are used in improving and protecting roads already in use.

A tarviated road or pavement is practically dustless and mudless and the maintenance cost is, in most cases, so reduced as to more than save the cost of Tarvia treatment.

Booklets on request.

BARRETT MANUFACTURING COMPANY

Digitized by Google

officials of the Indiana Automobile Manufacturers' Association, the Hoosier Motor Club, Chamber of Commerce and other civic bodies, was held at noon. The parade began at 2 in the afternoon, a moving picture machine in the tonneau of a Marmon car recording the event for reproduction throughout the country.

The escort, composed of a large number of motorists in Indianapolis and vicinity, lined both sides of North Meridian street and proceeded to Eagle Creek bridge, where they again formed in two lines, through which the contestants passed, after the official pilot car had been presented with a large American flag by Lieut.-Gov. O'Neil. The contesting machines left at one minute intervals, the start being indicated by the firing of minute guns.

Each car bears its number in a prominent place so that it may be identified easily and, in addition to the passengers, a tent, blankets, lunch hampers, folding water buckets, block and tackle with 150 feet of rope, spade, folding axe, tire chains, jack, mudhooks and lantern. W. McK. White is tour chairman and C. G. Fisher official pilot. The pilot car acts as pacemaker each day and no machine is permitted to pass it. The detailed itinerary follows:

	Night Stop	Miles
July 1,	Terre Haute, Ind.	71.7
July 2,	Springfield, Ill.	150.0
July 3,	St. Louis, Mo.	117.7
July 4,	Columbia, Mo.	136.0
July 5,	Kansas City, Mo.	158.9
July 6,	in Kansas City.	
July 7,	Fort Riley, Kan.	156.6

Aug. 2,	Los Angeles, Cal.	105.8

Particular interest attaches to at least four of the cars in the event. Two of these are the Haynes machines, one of which is being driven by Elwood Haynes, who began experimenting with automobiles in 1891 or 1892. It was 20 years ago, in 1893, that the first Haynes car was produced, and the fact was recalled by Mr. Haynes as he stepped into his machine at the start.

"This is quite different from 1893," he said. "When I got into my first car I was supremely happy if, after some horses had pulled it along for a ways until the engine started, I could travel a few miles at a speed of 6.5 miles an hour. Times have changed, and now we start on a 3500-mile trip, over all sorts of roads and the desert as though we were entering a Pullman car. I expect to see still greater developments in the future, and within the next 10 years I hope to be able to step into my car and travel from coast to coast over an ideal highway."

The other two are the Henderson cars, at least one of which is equipped with the new Harroun kerosene carburetor. This machine is being driven by Ray Harroun, who already has made a name for himself in racing with Marmon machines, and who invented the carburetor in question. He proposes to cover the entire distance on kerosene and establish a new fuel economy record.

The smallest car in the event is the Empire, which expects to compete successfully with such well known long distance veterans as the Marmon, Stutz, Pathfinder, Premier, Apperson and McFarlan. The Pilot and Marion entrants also will bear watching, as soon as the returns begin to come in. A special telegram from Kansas City reports that the tourists arrived at that point on scheduled time without trouble, but the most difficult portion of the tour will be encountered after leaving Denver.

STUTZ WINS TWICE AT TACOMA.

Robert Burman in Keeton Finishes in Second Place in 200-Mile Event.

Earl Cooper, driving a Stutz car, won the 200-mile road race for the Potlach trophy at Tacoma, Wash., July 5, covering the distance in 2:49:32. Robert Burman in a Keeton was second, finishing the last 72 miles of the course with only three cylinders working. Latta in an Inter-State was third. The exact distance covered by the contestants was 200.81 miles.

Cooper and the Stutz also won the 250-mile free-for-all, July 6, covering the distance in 3:32:08.2. Hugh Hughes in a Tulsa was second and Harry Endicott in a Nyberg, third.

The performance of the Keeton car in the 200-mile event was particularly worthy of note, the finish of the race being made after the machine had been ditched in a brush with Tetzlaff. It averaged 60 miles an hour on three cylinders.

IN THE REALM OF THE MOTORCYCLISTS.

Manufacturers Lease Chicago Coliseum for November—Show Trophies for National Meet in Denver—Results of Independence Day Contests.

FOLLOWING an emergency meeting of the show committee of Motorcycle Manufacturers' Association at Chicago, the lease for the Coliseum in that city, for week of Nov. 3-8, to accommodate the Chicago national motorcycle show, has already been formally signed. The manager of the show is to be President A. B. Coffman of the association, and he has asked prospective exhibitors to make immediate application for space reservations, addressing him at 6 Glenwood court, Toledo, O. As was the case last year all privileges will be extended to the manufacturers of bicycles and accessories, as well as to motorcycle producers. The show committee consists of President Coffman, Arthur Davidson and R. W. Henderson.

Manufacturers Donate Trophy.

The Motorcycle Manufacturers' Association has presented to the Federation of American Motorcyclists a silver cup valued at $250, to be competed for under rules as laid down by the federation. The award will be known as the M. M. A. trophy cup, for private owners, to be competed for at each annual F. A. M. race meet. In case the event is postponed by rain or other causes the trophy shall be competed for before the first day of January following.

The time and place for such competition is to be decided by the chairman of the F. A. M. competition committee. Owners competing for the trophy must ride stock machines with full factory equipment, except that drop handle bars may be used and several other minor changes permitted. The trophy must be won three times in succession by the same rider to retain permanent ownership. The temporary holder must file a surety bond of $250 with the chairman of the competition committee to guarantee its safe keeping and prompt return. The first competition for the cup will be held during the national meet at Denver, Col., July 23-26.

Rules for Bosch Award.

The Bosch Magneto Company, New York City, maker of Bosch magnetos, has for the third consecutive year donated a magnificent silver trophy cup, known as the Bosch trophy, to be presented to the motorcycle rider who accomplishes the most consistent performance in the national amateur championship races of the United States during the national convention of the Federation of American Motorcyclists at Denver, Col., July 23-26.

The presenting of this trophy each year has brought out a new title in the F. A. M. rules, so that the winner this year will be officially recognized throughout the country as the amateur champion of America and will be in a position to defend his title against all comers, if necessary. The awarding of the Bosch trophy is to be determined by a point system, as follows:

Winner of the one-mile race to receive four points, second three, third two; two-mile winner six, second four, third two; five-mile winner seven, second five, third three; 10-mile winner eight, second six, third four; 25-mile winner 12, second seven, third five; 50-mile winner 15, second 10, third eight.

Bosch Trophy to Be Awarded at Denver Meet.

It will be necessary for the winner of the trophy and title to compete in all events, the point system thus allowing the rider who may receive only third place in the one-mile race to have excellent chances to win the trophy by bettering his position in the succeeding races. It is expected that the interest in the coming national meet will be sustained throughout the three days, as the winner of the trophy will not be known until the last championship race has been run and all of the various marks for each event have been totalled for each man.

New One-Hour Record.

The one-hour motorcycle record was exceeded at Brighton Beach Stadium motordrome, New York City, when Michael Costello of New Rochelle, N. Y., led a field of seven at the finish with 74 miles and one lap to his credit. The former record of 62 miles was held by William Ray, made last year over the same track. John Cox of New York City was second with 73 miles and two laps, and Hartley Thomas third with 70 miles and two laps.

Worcester to the White Mountains.

The Worcester Motorcycle Club, Worcester, Mass., recently held a 24-hour endurance run, which covered 430 miles, beginning at Worcester and including Arlington and Lowell, Mass., Concord, the Weirs, Conway and Bretton Woods, N. H., returning by way of Plymouth, N. H. Of 40 machines which started 21 finished. Of these 11 were Indians, three Excelsiors, five Harley-Davidsons and one Thor. The official figures show the run was won by Worcester second Indian team, comprising C. Nelson Robinson, F. L. Kidder, Gustaf Johnson and Paul Brown. This team scored 3806 points, while the Excelsior team, consisting of Edward L. Plimpton, W. S. Bunker, Ralph A. Corey and John Livingston, was second, with 2916 points. The Harley-Davidson team took third place with a total of 2811, while the Indian No. 1 team scored an even 2000 points.

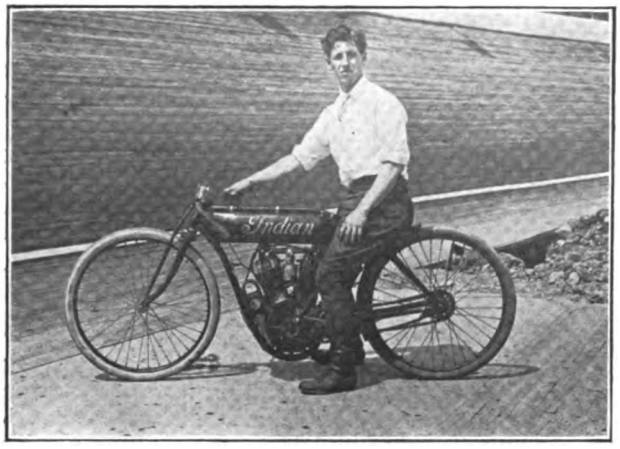
Members of the Providence Motorcycle Club, Providence, R. I., Enjoying a Clambake on a Recent Outing.

Following are those who finished with perfect scores: F. D. Johnson, Indian; Roy Dow, Indian; W. S. Bunker, Excelsior; Robert Corey, Excelsior; C. N. Robinson, Indian; F. L. Kidder, Indian; G. Johnson, Indian; A. H. Batchelder, Indian; Edward Coderre, Indian; A. L. Hawkes, Indian; E. Hills, Thor; B. C. Thayer, Harley-Davidson; William Tannebring, Harley-Davidson; C. Loftes, Harley-Davidson. Other scores were: A. Zimmerman, Indian, 988; A. LaRose, Indian, 980; W. H. Burnett, Harley-Davidson, 980; J. Livingston, Excelsior, 916; E. W. Padelford, Harley-Davidson, 911; P. Brown, Indian, 806.

Elgin National Road Race.

Over the Elgin course at Elgin, Ill., the motorcycle classic of the year was held July 4, under the direction of the Chicago Motorcycle Club, the 250-mile race being witnessed by a record breaking crowd. Charles Balke, riding an Indian machine, was the winner, with an average speed of 55.4 miles an hour. Erwin G. Baker finished a close second, with Charles Gustafson, third. These two riders also were mounted on Indian machines.

The supremacy of the board track riders seems to have been demonstrated in this event, as all three winners have national reputations as motordrome racers. Speculation was rife previous to the race whether the board track men could successfully compete with the experienced road men. The riders were started at intervals of 30 seconds and the first prize was $500 in gold coin; second, $250, and third, $125. Following are the teams entered by the various factories:



Indian, Charles Balke, Ray Seymour, Charles Gustafson, E. G. Baker; Flying Merkel, S. Taylor, Roy Bowser, Ray Snyder, Herman Sill; Yale, Ivan Jacobs, Shorty Matthews, Raymond Ray; Excelsior, Leslie Allen, Daniel Armstrong, Edward Bomark, Joseph Wolters; Dayton, George Lyons, F. C. Raff, William L. Walsh; Jefferson, W. G. Hamilton, Ray Comstock, Rudy Thoms; Harley-Davidson, R. Ketcham; R-S, Gray Sloop, champion of North Carolina, whose real name is not disclosed. In addition to these teams there were many individual riders entered.

New Official Repair Shops.

New repair shops recently registered with the F. A. M. are as follows: George D. West, Eskridge, Kan.; A. T. Crabb, 214 West National avenue, Brazil, Ind.; Taunton Cycle Company, 28

Digitized by Google

Cohannett street, Taunton, Mass.; Amos Shirley, 935 Eighth avenue, New York City; Edward Nyswander, Grand Rapids, O.; Seeber & Hofheins, 704 Main street, Buffalo, N. Y.; Wheeler & Davidson, 71 East Market street, Corning, N. Y.; Hugo Scheeren, 3119 Third avenue, New York City; George E. Whitcomb, Marshall, Minn.

J. U. Constant, Brooklyn, N. Y., Who Took Five Out of Six Events at Elmira.

Constant a Consistent Winner.

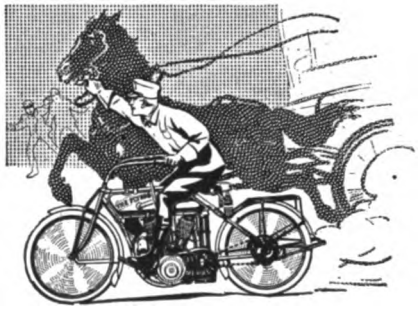
John U. Constant of Brooklyn, N. Y., had an easy task in winning five out of six racing events at Elmira, N. Y., July 4, in connection with the New York State convention of the F. A. M. In only the 10-mile event was he forced to exert himself, A. R. Duff of Toronto, Can., finishing second by a close margin.

State and Local Commissioners.

Roy Pascal, 270 South Sixth street, Newark, N. J., has been appointed a state commissioner of the F. A. M. by President B. J. Patterson. Other local commissioners appointed are: C. F. Dix, box 114, Stockton, N. J.; W. C. Tatham, Waterloo, Ind.; D. B. DeMuth, 1116 Byron street, Huntington, Ind.; J. A. Anderson, 211 North Michigan street, South Bend, Ind.; Charles C. Palmer, Chalmers, Ind.

Merkel Retires from Miami Company.

Joseph F. Merkel, mechanical engineer of the Miami Cycle & Manufacturing Company, Middletown, O., maker of Merkel motorcycles, and one of the veterans of the motorcycle industry, has retired from that concern. Mr. Merkel returned two weeks ago from a business trip abroad in the interests of the company and having fulfilled his mission his retirement followed.



With his brother, Mr. Merkel formed the Merkel Motor Company at Milwaukee, Wis., about 12 years ago and since that time he has been identified with the motorcycle industry. He was the first to apply a spring frame to a motorcycle. When the motor car began to attract attention Mr. Merkel commenced the manufacture of a car at his factory, but later confined his endeavors to the production of motorcycles. The company was subsequently taken over by the Light Manufacturing & Foundry Company, Pottstown, Penn. That concern could not carry on the manufacture of motorcycles readily because of its other interests, so the business was sold about three years ago to the Miami Cycle & Manufacturing Company, when Mr. Merkel also became identified with that concern, the striking success of which is too well known to need repetition.

Winners of Old Sol Lamps.

E. M. Estabrook, chairman of the membership committee of the F. A. M., has announced the following clubs as the winners of Old Sol lamps in the membership contest: Corning Motorcycle Club, Corning, N. Y., two lamps; Nashville club, Nashville, Tenn., and Passaic club, Passaic, N. J., one lamp each.

Goodyear Tires Cost Less.

S. A. Falor, manager of the motorcycle tire department of the Goodyear Tire & Rubber Company, Akron, O., maker of Goodyear tires, recently announced a 10 per cent. reduction in the

ALWAYS READY FOR ANY EMERGENCY!

With its ability to pick up speed quickly—(60 miles an hour from a standing start within a city block)—the 1913 Flying Merkel Motorcycle is always ready for instantaneous use. These features and the fact that the Flying Merkel Motorcycle is the most economical in the world to operate has led to its universal adoption by Police Departments, Park Boards, Gas Companies, Telephone and Electric Light Companies and all other business concerns and individuals whose requirements demand a sturdy, reliable motorcycle at the minimum cost of upkeep. Remember, the Flying Merkel

prices of motorcycle tires to dealers, consumers and jobbers. In explaining the reduction Mr. Falor said it was not due so much to the fact that the crude rubber market was lower, but because of the increased volume of motorcycle tire business which his company now has.

Results at Bay State Meet.

Some fine motorcycle racing was staged on the old race track at Saugus, Mass., July 4, during the convention of the Bay State Motorcycle Club, which was held at Boston. Over 5000 persons attended the meet, one of the chief attractions being Ronald Pope of Los Angeles, Cal., who captured the main event of the day, the 25-mile race for professionals. The closest contest was the 10-mile professional, which was won by H. F. Smith of Boston, second place going to

Two Members of the Merkel Team in Elgin Road Race: At Left, L. S. Taylor; at Right, Ray Snyder.

Theodore Carrol of Springfield, Mass., after the hardest kind of a battle on the home stretch. The following are the results:

Five miles, novice—First, Bernardt Gorgensen; second, E. W. Scherer; third, Ernest Marble; time, 6:22.

Ten miles, professional—First, H. F. Smith; second, Theodore Carrol; third, Ronald Pope; time, 11:11.8.

Ten miles, amateur—First, Bernardt Gorgensen; second, Ernest C. Poole; third, E. W. Scherer; time, 11:07.8.

Five miles, amateur—First, C. E. Vesselo; second, B. E. Dexter; time, 7:04.8.

Five miles, professional—First, H. E. Hendrickson; second, Ronald Pope; time, 6:39.4.

Twenty-five miles, professional—First, Ronald Pope; second, Porter Halliwell; third, Thomas Grace; time, 29:10.

Stewart-Warner Speedometer Prizes.

Motorcycle riders and that part of the general public which patronizes or even passes motorcycle dealers' stores, are to be given an opportunity to show their ability as judges of high class art, with several substantial prizes as a reward for their efforts. They are to be asked to suggest an appropriate title for a painting purchased by the Stewart-Warner Speedomoter Corporation, maker of Stewart-Warner speedometers. A first prize of any motorcycle manufactured, costing $300 or under, and three other rewards of Stewart motorcycle speedometers are offered for the four best titles submitted.

Every motorcycle dealer in the United States will be provided with copies of the painting, to be hung in the windows and on the walls of the store. Customers and others will be invited to suggest a title for the picture, post card blanks being provided by the dealers. The titles will be sent to the Stewart-Warner corporation and the winners will be decided by competent, disinterested judges. The dealer in whose store the copy of the painting which suggests the winning title is hung, will also be awarded six model D Stewart speedometers.

New Affiliated Clubs.

The following new clubs have affiliated with the F. A. M.: Wheeling Motorcycle Club, Wheeling, W. Va., 26 members; secretary, Herbert L. Cotton, Elm Grove, W. Va. Eugene, Eugene, Ore., 18 members; secretary, C. Earl Fonda, 832 Olive street, Eugene, Ore. Bronx County Motorcycle Club, New York City, 20 members; secretary, Hugo Scheeren, Jr., 3119 Third avenue, New York City. American Indian Motorcycle Club, Chicago, 37 members; secretary, F. H. Kemper, 619 Diversey avenue, Chicago. Niagara Falls, Niagara Falls, N. Y., 59 members; secretary, J. F. Mackenna, 819 Ashland avenue, Niagara Falls, N. Y.

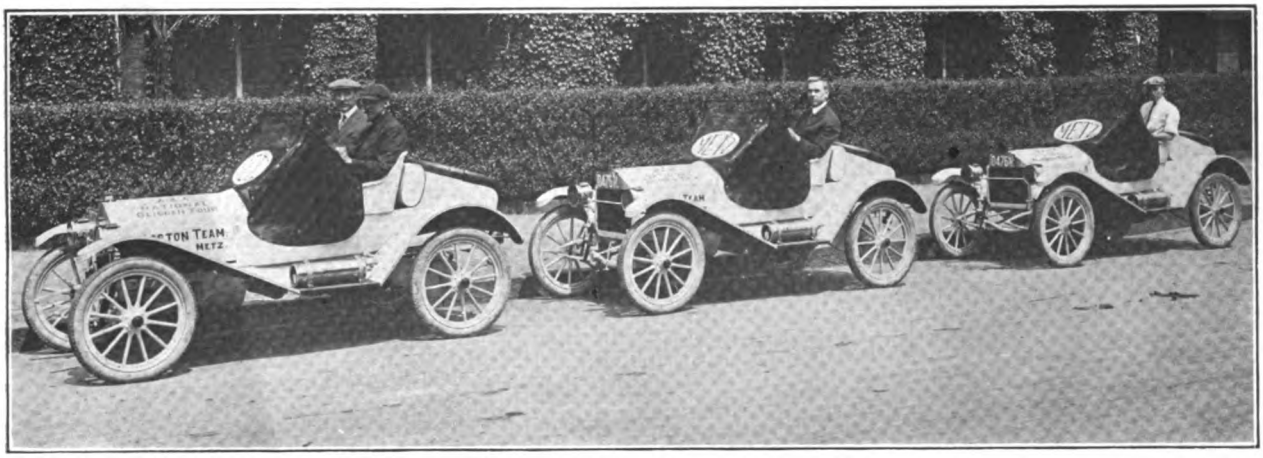
NATIONAL RELIABILITY TOUR.

Thirty Cars Will Leave Minneapolis on Long Run to Glacier National Park.

Everything is ready for the 1913 national reliability tour of the American Automobile Association, and according to the most recent announcement of the committee in charge no less than 30 cars will leave Minneapolis, July 11, for the nine-day run to Glacier national park. The tour will follow closely the itinerary used by the Minnesota State Automobile Association on its Minneapolis-Helena run in 1911, departing from that route only during the last day, when the detour will be made to the gates of the national reservation.



In several respects this event will be an innovation. It takes the place of the so-called Glidden tour, the first of which was held in 1905. No contest of this character was held last year, although a pathfinder was sent over the road from Detroit to New Orleans, after which the project was abandoned. For the first time in the history of the industry, American Indians are to compete, driving their own cars, and women have been permitted to enter as well.

Most of the entrants are private owners, although there are three factory teams. In the East, considerable interest attaches to the entry of three Metz cars, by the Metz Company, Waltham, Mass., this team representing Boston. Still another Metz machine will make the trip, this being driven by the Metz twins, the Misses Irene and Lillian. The official Metz team will be driven by John McGann, Walter Metz and Lawrence Cathcart.

The other factory teams are composed of K-R-I-T and Hupmobile cars, entered by the K-R-I-T Motor Car Company and Hupp Motor Car Company, both of Detroit. The K-R-I-T team will be in charge of Frank Witt, M. Mullaney and R. Hanson, and the Hupmobile cars will be driven by Frank J. Mooney, Thomas Hannon and R. W. Munser, Jr.

Following the plan which was adopted by the Minnesota state association in 1911, a hotel train will accompany the tourists throughout the long journey. The night stops and daily mileages follow: July 11, Alexandria, Minn., 144.4 miles; 12, Fargo, N. D., 123.8; 13, rest at Fargo; 14, Devil's Lake, N. D., 194.6; 15, Minot, N. D., 135.6; 16, Williston, N. D., 136.8; 17, Glasgow, Mont., 163.8; 18, Havre, Mont., 156.1; 19, Glacier Park, Mont., 178.

A special feature in connection with the run is the additional road test to which one of the Metz cars will be subjected. This machine left Boston at midnight, July 4, in charge of Walter Metz, for an overland journey to Minneapolis, and was due to arrive at the city hall in that city in 96 hours. This adds several hundred miles to the 1233.1 of the tour. The Metz team is illustrated herewith.

The Metz Team in the American Automobile Association's National Tour: Drivers, John McGann, Walter Metz and Lawrence Cathcart.

The Cole Motor Car Company, Indianapolis, Ind., maker of Cole cars, has issued the July number of the Cole Bulletin, the house organ. The issue is one of the best appearing from this house and contains numerous articles of a solid business nature by Homer McKee, director of sales and advertising, C. J. Corkhill, district sales manager, and others. The publication is finely illustrated with half-tones and altogether is a commendable literary effort.

AMES SHOCK ABSORBER.

Operates Automatically, Absorbs Vibration, Simple in Design and Easily Attached.

It is a well known fact that it is the recoil, not the down-thrust when the car encounters an obstruction, that breaks springs. It is the elimination of the abnormal upward movement, and the absorption of vibration and shocks, which stresses shorten the life of the machine and tires, that designers of shock absorbers seek to overcome. A shock absorber which presents practical features as well as makes for ease of attachment is the Ames automatic, for which Clarence N. Peacock & Co., 1790 Broadway, New York City, is exclusive licensee.

As will be noted by the accompanying illustration the Ames is simply an inverted three-leaf steel spring rigidly fastened to the main leaf spring with a carefully adjustable steel spacing block between them. When the car strikes an obstruction the recoil travels back and forth from the main spring to the shock absorber, instead of reaching the body of the machine, the stress of the recoil being wasted. It is a counter spring in that the vibration is smothered, preventing its communicating with the main member, and it is held that the action is very gentle. As the Ames works one way and the spring the other, all movements are compensated for. It is automatic in its action in that it adjusts itself to the character of the roads and lying as it does close to the spring it does not detract from its appearance.

Showing Simplicity of Ames Shock Absorbers: A, Method of Fitting to Front Spring; B, Rear Installation; C, Position of Absorber and Spring at Sudden Deflection.

The simplicity of application will appeal to those motorists who care for their own cars, as it can be attached easily by removing the regular spring clips and substituting those furnished by the maker, placing the spacing block and tightening nuts with a wrench. The Ames is constructed of chrome vanadium steel, heat treated and assembled by skilled workmen. The absorbers come in sets of four and are adapted to any type of spring and vehicle. As they do not affect in any manner the normal action of the regular springs, simply absorb the recoil and vibration, it will be seen that there are no adjustments to be made or other factors to be considered.

SPECIAL WEED CHAIN PRIZES.

Maker Will Award Cash for Best Window Displays of Product.

Tourists and others cannot help but have their attention called to the necessity for carrying Weed tire chains during the next few weeks. The maker, the Weed Chain Tire Grip Company, New York City, is offering $250 in cash in prizes—$100 to the first, $50 to the second and $10 each for the next 10—for the best window displays, the award being based upon general attractiveness.

The company does not furnish display material for this contest, the idea being to secure originality on the part of the dealer. The Waite Auto Supply Company, Providence, R. I., for instance, has evolved an interesting object lesson in reproducing a scene at a railway crossing, in which one of the cars is equipped with Weed chains and the other—the one which is the victim of the accident—is not. Toy cars and locomotive and miniature dolls are used with good effect.

All photographs of displays entered for the prize must be in the hands of the company not later than July 15, and it is planned to announce the winners Aug. 1.

BOWERS CARBURETOR.

Gilbert Manufacturing Company Announces New Popular Priced Design.

Announcement is made by the Gilbert Manufacturing Company, New Haven, Conn., of a new type Bowers carburetor which will sell at a popular price. The model G contains all of the latest improvements and is guaranteed to show a high efficiency as well as economy of fuel. The company also makes a high grade line of accessories, including tire and lamp covers, tube bags, etc.

ANNOUNCES NEW MODEL.

Lozier Returns to Four-Cylinder Motor After Producing Sixes Exclusively.

One of the surprises of the past week was the announcement made by the Lozier Motor Company, Detroit, of a new four-cylinder model for the 1914 season. This is of particular interest because of the fact that the Lozier company has been producing sixes exclusively for the past two years. The announcement was made in connection with the annual convention of district and sales managers at the plant in Detroit.

It is understood that the new model will resemble the Lozier Little Six in general appearance, the body following the stream line design, although several new features will be incorporated. Notable among the latter will be the crowned fenders now quite the style in Europe. It will seat seven passengers, the two extra seats in the tonneau being so arranged as to fold against the back of the front seat when not in use.

The new motor is of the L head type, with bore of 4.25 inches and stroke of 6.5. The lubrication system is the same as that which has been utilized with success on the six-cylinder models. Ignition is by Bosch magneto. The clutch is of the multiple disc type, housed in the engine flywheel and running in oil. The transmission affords three forward speeds and reverse.

The frame is raised over the rear wheels, lowering the body and centre of gravity and making for easy riding qualities. Left hand steer and centre control are continued with this model. The wheelbase is 120 inches and the wheels are shod with 36 by 4.5-inch tires all around. The equipment will be complete in every detail, including Gray & Davis lighting and starting system.

DETROIT'S FIRST CYCLECAR.

Keeton Officials Interested in Company Producing the Carnation.

The first completed cyclecar to make its appearance on the streets in Detroit is the Carnation, an illustration of which is shown herewith. This is to be produced by the American Voiterette Company, of which Charles B. Shaffer, president of the Keeton Motor Company of that city, is president. William G. Houck, 2nd., vice president and director of sales with the Keeton company, holds the same positions with the new concern, which is capitalized at $500,000.

The Carnation is a cyclecar in every sense of the word, having a 44-inch tread and 100-inch wheelbase. The motor has four cylinders, with bore of 3.25 inches and stroke of 3.75, being rated at 18-24 horsepower. The car has three forward speeds and reverse, and drives from the centre with right hand shifting lever. The wire wheels are shod with 30 by three-inch tires.

There are three models and with all the seats are of the French type, having sloping backs, and the upholstering is Bedford cord. The model illustrated, which is the first to be produced, has two seats, arranged tandem. The others are a touring car, seating four persons, and a roadster, seating two people side by side. The car weighs 710 pounds, is low in construction and has a speed of about 50 miles an hour.

Detroit's First Completed Cyclecar, the Carnation, Made by the American Volterette Company.

BIG MILEAGE RECORD.

Franklin Car Utilizing Newcomb Carburetor Exceeds Former World's Mark.

Utilizing a Newcomb carburetor, made by the Holtzer-Cabot Electric Company, Boston, Mass., a Franklin car covered 83.5 miles on a gallon of fuel in tests under the auspices of the Automobile Club of America, in New York City, June 21, creating a new world's record. The trials were conducted over the Long Island roads under ordinary highway conditions.

JOINS THE COLE FORCE.

J. G. Monihan Becomes a Member of Homer McKee's Sales Organization.

John Guy Monihan of the Premier Motor Manufacturing Company, Indianapolis, Ind., maker of Premier cars, has become associate director of sales and advertising of the Cole Motor Car Company, Indianapolis, maker of Cole machines. This is in accordance with the plans for expansion worked out by Homer McKee, director of sales and advertising, at the suggestion of President J. J. Cole. Edward F. Harris, whose work in the sales department of the Cole organization justified his advancement, has been promoted to field sales manager. This expansion follows closely on the recent announcement of increase in Cole stock to $1,000,000, the doubling of the Cole output and the closing of a contract for another big addition to the factory on East Washington street.

In securing Mr. Monihan, Mr. Cole believes that his already strong sales and advertising organization has been materially strengthened. Mr. Monihan has been in the automobile business for the past five years. His most recent experience has been with the Premier company, where he was closely associated with President H. O. Smith and R. W. Macey. With his co-operation Premier business has steadily increased. He was the originator of the amateur transcontinental ocean-to-ocean tour in 1911 and has won a name as a sales lecturer. He has written several books and is a member of numerous clubs and organizations throughout the country.

GOODYEAR ELECTRIC TIRE.

Well Known Maker Announces New Product Will Be Ready Shortly.

L. C. Rockhill, manager of the automobile tire department of the Goodyear Tire & Rubber Company, has returned to the factory in Akron, O., after an extended tour of the Pacific Coast section, investigating motor car conditions in that portion of the country. Shortly after his return he announced a new electric vehicle tire, to be known as the Goodyear Power Saver pneumatic tire, which he says will be ready for distribution at the various branches of the company about the middle of the month.

The new tire is the result of long experience on the part of the engineers connected with the Goodyear company, and is expected to afford the maximum of efficiency in every respect. In discussing the matter Mr. Rockhill mentions that very few people diffentiate between tires for gasoline cars and those especially built for electrics, although he says any automobile engineer knows that the former absorbs more energy than the latter. In order to secure a product that should prove satisfactory in every respect, the company is using only the better grade of gum and the very best cotton in an effort to obtain extreme durability without loss of resiliency.

H. S. Quine, manager of the advertising department of this company, also makes an announcement, in which a proposition is placed before Goodyear dealers whereby they can co-operate with the company in securing road signs at a saving of some 82 per cent. of the cost. The signs are lithographed on steel, 10 by 28 inches, and besides calling attention to the merits of Goodyear No-Rim-Cut tires, carry the advertisement of the local dealer. The plan is advanced as another step in the effort of the Goodyear company to co-operate with its representatives in every way possible.

The Chicago automobile insurance interests have appointed a committee made up of A. T. Graham, Fred H. Moore and A. F. Shaw to prepare a constitution and by-laws for the permanent organization to take the place of the tentative organization which has been in charge for some time. It is probable that it will be called the Automobile Underwriters' Board of Cook county. The eastern conference rates are practically in effect in Cook county.

The Bosch Magneto Company, New York City, maker of Bosch magnetos, has donated. through its president, Otto H. Heins, a one-mile international record cup to be known as the Bosch trophy, to the Motor Boat Club of America. The award is to be perpetual and a silver replica of the cup will be presented to the owner of the winning boat in appreciation of his efforts. It is necessary that boats representing two or more countries shall compete and the winning club shall hold the trophy for one year. This year's competition will be under the direction of the Royal Motor Yacht Club of England, as the donor requests that whenever possible it shall be competed for in connection with the Harmsworth trophy races. The winner will be entitled to the distinction of being recognized as the fastest motor boat in the world.

Digitized by Google

The touring season in the Southwest is being formally ushered in this year by the second annual Grand Canyon run, which, with 50 cars in line, promises to be the largest and most important event of its kind in Arizona. The initial run was held last year as a protest against the rough, uncared-for roads, and already highway improvement has become apparent. The event, like that of last year, is open to Studebaker cars only. Though starting at Phoenix, it includes entries from Prescott, Tucson, Flagstaff and other Arizona towns, with several cars from Los Angeles. On the six-day itinerary the tourists will spend one night at Prescott and one in the tourist hotels at the Canyon. The other three nights the party is to be cared for at the famous Harvey houses of the Santa Fe railroad system.

Following its official non-stop run of 300 hours at the Automobile Club of America, New York City, the Packard 38 motor, which established this record, is prolonging its endurance test by additional mileage on the road. After the completion of the block test, which more than doubled the previous world's record of 132 hours, the motor was sealed under the observance of the technical committee of the Automobile Club and replaced in the chassis from which it had been taken. It was then run at full speed on the Long Island speedway and from New York to Philadelphia. It still carries the seals which show it has undergone no adjustments. During the 300 hours of continuous running on the test rack the motor made 21,600,000 revolutions at a constant speed of 1200 a minute. This represents 11,238 miles, a distance greater than a run from New York to Shanghai, China.

STATEMENT OF THE OWNERSHIP, MANAGEMENT, CIRCULATION, ETC.

Of **The Automobile Journal** Published **Semi-Monthly** at **Pawtucket, Rhode Island,** required by the act of August 24, 1912.

NOTE—This statement is to be made in duplicate, both copies to be delivered by the publisher to the postmaster, who will send one copy to the Third Assistant Postmaster General (Division of Classification), Washington, D. C., and retain the other in the files of the postoffice.

None.

WILLIAM H. BLACK, Editor.

Sworn to and filed with Postmaster July 11, 1913.

ARTHUR H. CAPWELL,
Notary Public.

My commission expires June 30, 1914.

The legislature in Vermont recently passed a law forbidding motorists from using red lights at the rear of their machines. The action was taken following an insistent request from railroad engineers, similar to that which has been made in several other states. The law does not go into effect until Jan. 1, 1915.

"SEE AMERICA FIRST"

America Is Richer in Ruins by a Thousandfold Than All of Europe Combined

In the Great Southwest, One of the Most Enlightened Races the World Has Ever Known Lived, Departed and Left No History Within the Knowledge of Today.

"The Trail of The Bull Dog"

By CHAS. G. PERCIVAL, M. D.

Tells the Story of These Ruins, Which Belong to a Civilization Compared to Which the Oldest of European Monuments Are of a Period so Recent as to Seem But Yesterday.

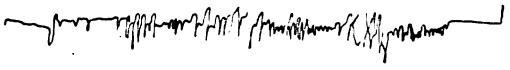
This book contains the incidents of Dr. Percival's two years' automobile trip into all parts of the North American Continent—1500 miles in Mexico during the height of the recent insurrection—1000 miles farther north than ever before by motor car, driving over the dreaded White Pass Trail from Skagway, Alaska, tidewater to the headquarters of the mighty Yukon River in the Klondyke, and north of 62 degrees—lost in the Arizona Desert and rescued from death by thirst by Troop K of the 4th United States Cavalry—crossing the highest points of the Sierra Nevada and Rocky Mountains, and visiting every state in the Union.

It is the most interesting and instructive book on America for Americans that ever has been printed.

You should read it before beginning the tour—You should read it even if you do not tour—Learn about the country you live in.

Splendidly Illustrated with Hundreds of Photographs Taken by the Author.

PRICE 50 CENTS PREPAID



CHAS. G. PERCIVAL, M. D.

J. M. Shock Absorber

Here is proof that will convince any man on earth

THESE SIMPLE GRAPHS TELL THE STORY:

WITHOUT J. M. Shock Absorbers—excessive vibrations

WITH J. M. Shock Absorbers—all roads are smooth

This diagrammatic record was made by the oar of Earle L. Ovington, the famous aviator, on Boston's finest boulevard—Commonwealth Avenue. It proves more convincingly than volumes of generalizations the fact that

You *Need* J. M. Equipment On *Your* Car

not only as protection against jolting on rough roadways, but also for continuous service on the best city streets.

We have prepared an interesting booklet "D" giving the full results of the noteworthy Ovington experiments on shock absorption—conducted with scientific accuracy over roads of various sorts. The facts contained therein should be known to every well-informed motorist.

Send your name and address—a postal will do—and a copy will immediately be forwarded, postpaid.

25 Miles to Gallon

PAID FOR ITSELF

Lawrence, Mass., May 16, 1913.
Gentlemen:—I get 20 miles and over on a gallon and I never got more than 14 miles on the ——— I took off. G. A. Schmidt.

19 to Gallon on Cadillac

Planhard Co.—Edgewater, N. J., May 21, 1912. I am very much pleased with my new Planhard Carburetor. I made a test of gasoline consumption from Edgewater to Hyde Park, N. Y., and return, and got a fraction over nineteen miles to the gallon. This is on my Cadillac.
John H. Hinners.

18 Miles on Buick

Malvern, Iowa, April 8, 1913.
Gentlemen:—The Planhard beats anything I ever saw. My first run was 55 miles on 3 gallons, and roads not good anywhere, 20 miles being very hilly and rough. An auto man said it was simply a wonder. It is a peach. Impossible to make it miss. Lots of power. All O. K. believe me. J. A. Tyler.

3¾ More Miles

When Planhard Carburetors were put on the 6 cylinder, 4 cycle Frisble motor of the fast boat Delphi II, she increased 230 R. P. M., and 3¾ more miles per hour.

Much More Power

Bath Marine Construction Co.—"The gasoline consumption at normal power was better than others and it would develop much more power when pushed." H. D. Bacon, President.

On a Ford

North Fairfield, O., May 16, 1913.
Gentlemen:—After taking the old Carburetor off my Ford car and putting on a Planhard, I increased my mileage from 18 to 25 miles per gallon, and my engine, which was a notorious heater, runs as cool as desirable for the best results. I am using 60 to 62 gasoline, and as I have a hydrometer, I know what I am talking about. A. W. Grandon.

Gallon Less Per Hour

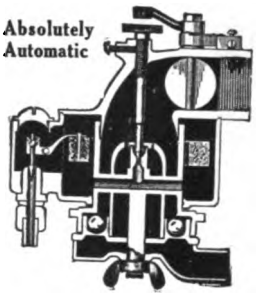
on semi-speed boat

HARTFORD III

owned by A. N. Smith, Portland, Maine, who gets better control.

Old Glory II

had a Planhard on her Loew-Victor on her famous trip to Nova Scotia.



Valient II and Alfred S

took all their prizes with Planhards on Metropolitan motors.

Emerson III

made a mile in 1 minute 8 seconds over the Washington government course with Planhards.

Absolutely Automatic

Note Simplicity.

Why don't you *own* the vulcanizer you're *paying for?*

Yes, actually paying for it in tire service that you might have—but don't get.

You know what happens when you let a casing cut gather dirt and water for a hundred miles. The fabric, that ought to be protected by the tread, rots, and you have a blow-out that ruins the tire.

Unless you have a vulcanizer, casing cuts will never get any attention. They don't look important enough to turn over to a garage for repair.

Result—you buy two tires where one would do as well.

SHALER Vulcanizer

If you'll fill the cuts and gashes in your tires with new, live Para rubber, and weld it in with a Shaler Vulcanizer, the tire will be as good as new until the tread is worn through. Why endure the trouble and danger and expense of blow-outs when there's this sure remedy? There is no satisfactory substitute for vulcanizing. No other method makes permanent repairs. All tube injuries are mended with the same vulcanizer.

You or your chauffeur can do the work in spare moments. No skill or experience necessary. Full directions and a supply of repair material accompany each machine.

Shaler Vulcanizers operate from your electric lighting circuit or with alcohol lamp. Prices, $2.00 and up.

Send This Coupon

today and receive a complimentary copy of "Care and Repair of Tires." It gives a remedy for every tire emergency. Write today.

When your

DAYTON AIRLESS

tire strikes a stone—

the stone sinks into the tire, rubber is displaced, the "pier" (A) squeezes down and bulges out into the open spaces between (B). Naturally it follows that the tire passes over the stone with a very slight vibration or "bounce." With an air filled tire you are bound to get greater bounce—there is no outlet for the air and it therefore shoots away from the obstruction point and back again with a rush, throwing you into the air. Dayton Airless tires provide for the comfort—the ease that you *must* have.

But much more; "airless" means complete freedom from tire trouble, punctures, blowouts, etc., and the long train of worry, danger, delays, annoyance, expense. ¶"Air-free, care-free," and wear-free besides; they last longer than any other kind. We guarantee Dayton Airless for 5000 to 8000 miles; according to the weight of your car.

¶Ask us to prove these facts to you. Send for our Cathechism; shows you that tire economy is not always in the first cost; shows you a newer kind of automobiling pleasure.

The construction does it

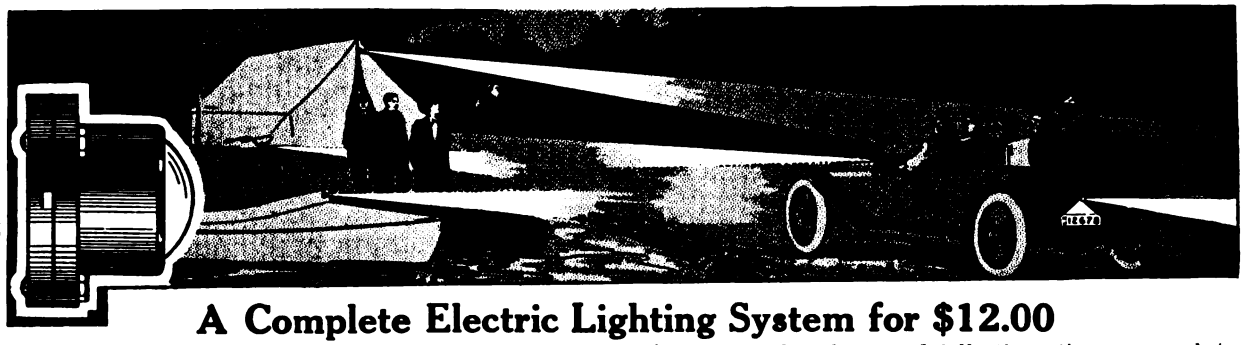
The "Black Eagle" Spark Plug

PATENTED

50 Cents Is Enough

The "Black Eagle" Spark Plug has made good because it was designed and manufactured with this result in view.

A person in close touch with the supply and manufacturing ends of the trade was a visitor at our factory recently, and was shown the details of construction, including the machinery, testing, and assembling of the "BLACK EAGLE" Spark Plug. What he said we believe will be of interest to you, as it indicates the effort on our part to supply a high grade plug at a reasonable price. We therefore quote below his impressions.



> "I am simply amazed at the workmanship, material, and construction of the 'BLACK EAGLE' Spark Plug. When I saw this plug advertised at a price of 50c to the consumer, I naturally supposed it was a cheap, common, plug such as you occasionally find in jobbing houses on the bargain counter. I am convinced, after seeing these plugs tested, and examining minutely the machine parts which enter into their construction, that **no better porcelain spark plug is offered by any one, regardless of the price they ask.**"

We are not **influenced** by what our competitors **charge for spark plugs!** We have **ignored price precedent,** for the reason that a **high grade spark plug** can be manufactured and sold at **50c each, and that is enough.**

Sent prepaid on receipt of price. Made in all standard threads.

EMCO AUTOMOBILE OIL
EMERY MFG. CO

Manufacturers of deodorized gasoline and lubricating oils of every description.

It costs You Nothing to try EMCO Automobile Oil.

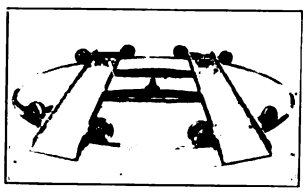
SELDOM do we acquire valuable knowledge without a given amount of time and expense. Experimenting is a costly proposition, especially when Automobile lubrication is involved.

Emco Oils eliminate every element of chance, by permitting you to prove them to your own satisfaction. To learn this costs you nothing as the following guarantee will show.

If Emco Oil does not prove satisfactory to YOU in absolutely every respect, we will refund your money in FULL---pay freight (both ways if oil is returned) and make no charge for oil used in trial.

Emco is the one automobile oil refined exclusively from Pennsylvania Crude. Its freedom from acids and all animal and vegetable matter make it wonderfully efficient. It is light bodied, of high fire test, free from carbon and lasts nearly twice as long as most oils. Emco Automobile Oil has taught thousands the subject of correct lubrication.

If your dealer cannot supply you we will ship Emco direct to you in five or ten gallon cans, barrels or half barrels.



EMERY MANUFACTURING COMPANY
Lewis Emery, Jr., Propr.
General Offices—45 Main St., Bradford, Pa.

Largest independent oil refiners in the world using exclusively Pennsylvania Crude. Annual capacity about 1,000,000 barrels.

References: Dun's, Bradstreet's or any National Bank.

Drive Your Car On This

A child can turn any weight car around.

Simply drive your car onto one, a simple push and the car is turned clear around ready to be driven out of garage. Also handy for cleaning and repairing. Save enough on concrete work to almost cover cost. Lasts a life time.

J-M
Spark Plug
IS GUARANTEED FOR 10,000 MILES

Think of it---10,000 miles! No other plug on the market is guaranteed so definitely by a responsible manufacturer. Could you ask for stronger proof of the superiority of the J-M Spark Plug?

Moreover, the J-M Spark Plug is guaranteed to be perfect in material and workmanship. We'll replace any plug that proves defective. Every J-M Plug is doubly insulated---sheet mica around the electrode, and porcelain around the sheet mica. Break the outer insulation of porcelain and the mica still prevents short circuit or current leakage, even when a magneto supplies the current.

Any size J-M Plug can be used for either battery or magneto ignition. Sold by dealers; or shipped prepaid from our nearest branch. Price $1.00 each.

Our nearest branch will forward interesting booklet on request.

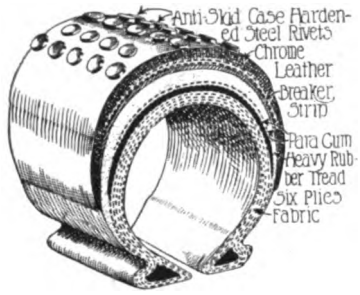
TIRE PROBLEMS SOLVED



BY THE

INVINCIBLE NON-SKID TIRES

PUNCTURE AND BLOW-OUT PROOF

GUARANTEED FOR 3000 MILES

By the INVINCIBLE process we rebuild completely your old, worn out casing, making it better than new. **New Fabric** and **Rubber** used throughout. The Chrome Leather is **solidly vulcanized** to casing, **eliminating heat** or **friction.** The **steel rivets** endure during life of shoe, a feature found in no other tire. The cost is but **four-fifths** that of a plain tread shoe. We pay express charges both ways.

Write for our booklet on tire troubles and how the INVINCIBLE eliminates them. References furnished. We have hundred of testimonials from users. **Full value for your money as you deal direct with the maker.**

Type 22 Ammeter, 2¼" Diameter.

THE CALL FOR THE SMALL.

With the almost universal application of electric lighting to the gasoline pleasure car has come an imperative demand for smaller meters. This is but natural as the dashboard space is limited, and the space requirements many.

Six years ago the Hoyt Electrical Instrument Works recognized the value of meters in promoting the efficiency of the gas car and designed their Type 25 Ammeters and Voltmeters for the purpose. This was the smallest practical switchboard meter on the market, and was but 3" diameter over all.

Thousands of them in constant use on pleasure cars the world over testify in the strongest possible manner to their value as an aid to efficiency.

Recognizing the popularity of Hoyt Type 25 meters, many electrical instrument manufacturers are now making 3" meters, but even the 3" meter is now considered too large, and the call is heard on every side for something still smaller. The Hoyt Type 22 meter is the response. 2¼" diameter, accurate, rugged, reliable.

Many 1914 cars will carry these meters as regular equipment.

DON'T BE ANTIQUE BE UP-TO-DATE

In every museum there's a niche waiting for the automobile hand crank.

And soon there will be niches for the people who continue using them.

Don't be antique. What's the use, when there are Electric Crankers that know their business and can do a better job of cranking than any human being?

Every Electric Cranking System must have a Storage Battery. The most—and best—include in their equipment the

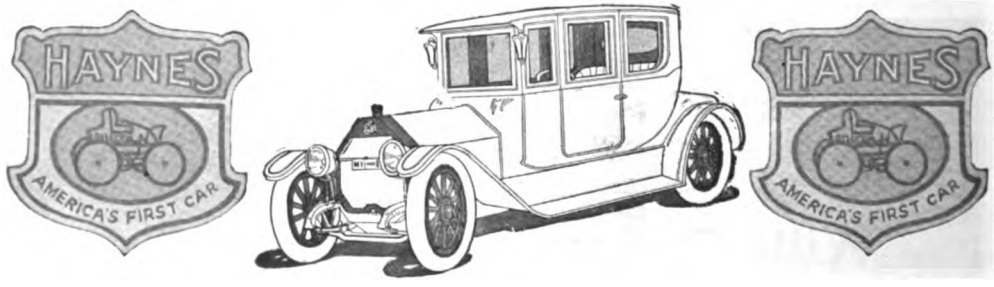
Honest Now, Mr. Automobile Dealer

Are You Making Enough Money?

Here's what a lot of dealers are up against. Maybe you're in this class. They are doing a good business—selling quite a bunch of cars and making a good profit, *if* they could *hang on to it.* But here's where the trouble comes in. Every time something goes wrong, (fancied or real) with the car of the customer, ting-a-ling goes the phone, or in comes Mr. Customer to have his car fixed up, and, of course, there can be no charge, because he bought it from Mr. Dealer and *he* is responsible.

Now there's just one way to dodge all this kind of trouble—get a car that doesn't need much of this kind of attention. Through all these 20 years of auto building, our one goal has been—make the Haynes perfect—make it so trustworthy and simple that it will stay in running order and give satisfaction through hard use and even abuse in the hands of unskilled drivers.

Connect up with the



HAYNES

—the Car *Without* the "Come-Backs"

We'll be glad to tell you how simple the Haynes is in every part—glad to tell you how carefully each car is manufactured in our own shops or under our direct supervision—glad to tell you the tests which every separate part, and the car complete are required to meet. We'll also be glad to tell you what Haynes dealers say as to the satisfaction given by the Haynes and how little bother they have with "come-backs."

Specifications of the New Haynes

Motor—Bore 4 1-4 in., Stroke 5 1-2 in. L-head Haynes. Cylinders cast in pairs.
Cooling—Centrifugal pump and pressed steel fan.
Wheel Base—Model 26, 130. Model 27, 136. Model 28, 118.
Ignition—American Simms Magneto.
Lubrication—Splash and gravity feed.
Control—Left hand. Vulcan Electric Gear Shift.
Transmission—Selective Type, three speeds forward, one reverse.
Steering Column—Worm and worm gear type.
Clutch—Haynes contracting steel band.
Rear Axle—Full Floating Timken on Models 26 and 27; McCue, Model 28. Gourney Bearings.
Front Axle—I-Beam. O. H. steel heat treated.
Wheels—Artillery type. Funk demountable rims.
Tires—Models 26 and 27, 36x4 1-2. Model 28, 34x4.
Springs—Front Semi-elliptic 39 1-8x2, rear 48x2.
Brakes—15 1-4 external and 15 internal on Models 26 and 27. 12 and 16 internal on Model 28.
Finish—Indian dark blue body.
Gasoline Feed—Pressure. Automatic feed.
Upholstery—Buffed leather—deep cushions.
Starting and Lighting—Leece-Neville electrical system.
Dash Equipment—Electric lights, sight oil feed, automatic cut-out for generator, dash light, auxiliary air pressure pump, air gauge and speedometer. Models 26 and 27 have rim wind clock.
Other Standard Equipment—Top, top cover of silk mohair, mechanical tire pump, rain vision ventilating wind-shield, Vulcan electric gear shift, two large electric headlights, electric side lights, electric tail light, full dash equipment, electric starter, generator, 80 ampere hour storage battery, speedometer, horn, coat and foot rails, tire irons, full tool equipment, and one extra demountable rim.

Digitized by Google

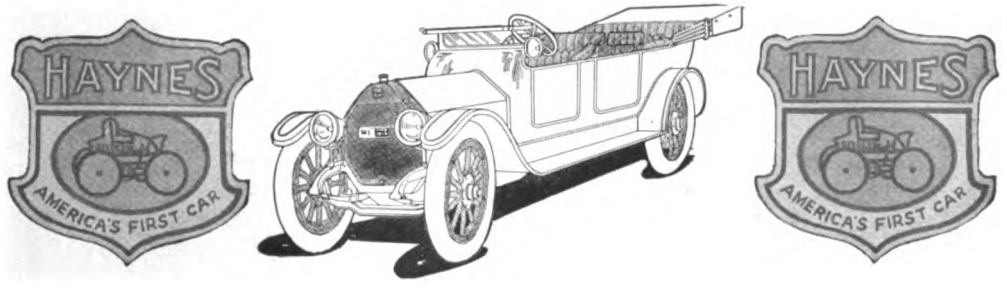
The New Haynes Models Have the Season's Biggest Feature—the Vulcan Electric Gear Shift

Here's another thing a lot of dealers are up against—and maybe this also applies to you. They're handling a good car, gives good satisfaction, customers pretty well pleased, but the drawback is—there is nothing different, nothing distinctive about the car to make people go out of their way to come in and see it.

The new Haynes has a selling wallop that brings the prospects in and helps you put over the sales. In addition to everything that can be desired in the way of comfort, convenience, equipment and prestige of twenty years building—it has the wonderful Vulcan Electric Gear Shift.

Connect up with the

HAYNES



—the Car that Is Always *First*

True to its reputation as pioneer and pacemaker, the Haynes was first to adopt this, the greatest improvement in automobile equipment. Added to the electric self-starter and electric lighting, is everything else in the way of modern equipment—it makes the Haynes the strongest kind of a selling proposition. Read the specifications and see for yourself.

Get After the Haynes Agency Today

If you are in business for money, not merely for your health—if you would like to get hold of the agency for a car that's a live seller, that's famous for its quality and dependability—that stays sold and stops the "profit-killing come-backs"—if you would like to do business with a *stand-by* and a *fixture* in the auto business, insure your business for the future—and if you would like to make the coming year *your biggest year*, write us today about the Haynes, America's First Car and the car with the wonderful Vulcan Electric Gear Shift.

MARMON

Old School Honor Plus The Efficiency of Today.

Plain, old-fashioned honor has been the foundation of many industrial successes. An honest effort to make the best possible goods to meet the requirements of the purchaser, a fair price placed upon these goods and square dealing with the buying public—these are among the things covered by that one word "honor."

Twelve years before the battle of Gettysbury, Nordyke & Marmon Company began the manufacture of machinery to meet highly exacting requirements. Since then more than 40 manufacturing concerns have entered the same field. some with large production and low prices, others with special methods of obtaining business and others with various propositions. Today Nordyke & Marmon Company, with no variation of its policy, is among five survivors of this varied competition. During the 62 years, it has never marketed a product built for cheapness or with any other end in view than the best possible service to the purchaser.

Has this "old-school honor" paid? The answer lies here—in one of the leading manufacturing institutions of the great Middle West, a concern owned by the family that founded it, a company with 62 years of constant, healthy growth and unimpaired credit.

In the early days of the automobile industry Nordyke & Marmon Company began to build motor cars, the best that brains, experience, money and honest intent could produce. Always abreast and sometimes in advance of the marvellous development of this new device for the pleasure and convenience of mankind, the Marmon has become known the world over as among the very few cars classed in the first grade. It will continue among the best so long as this great manufacturing institution endures.

The great manufacturing plant of Nordyke & Marmon Company, equipped and organized at every point for up-to-the-minute efficiency, is open to your inspection. You cannot visit it without gaining from every department the indelible impress of years of sound, successful experience—without carrying away with you the greater confidence in the future and product of such an organization.

"The Easiest Riding Car In The World"

MARMON

The Marmon "32" Five-Passenger Touring Car

Price, $3,000. Four-cylinder, 32-40 h. p., 120" wheelbase, body types and equipment to meet every requirement. A rational, logical car for touring and city use. Years of satisfactory service have proved its economy in tires, fuel and upkeep—plus smooth, delightful operation and durability.

ANNOUNCEMENT

For the coming season the Marmon "Thirty-Two" offers all the latest ideas in equipment, style and appointment.

The features of exclusive Marmon design, the scientifically selected materials and conscientious, expert workmanship, attain their highest development in this car.

The experience of sixty-two years of successful manufacturers of high grade machinery stands back of the refinement and mechanical perfection of the Marmon "Thirty-Two."

A few of its many superior features:

Marmon "32" Motor—Proved the best by comparison with the finest products of European and American makers in the winning of the most arduous of long-distance races and road tours, and backed by years of consistent service in the hands of owners. Four cylinder, 4½" bore, 5" stroke, 32-40 h. p., two spark, dual ignition system, large valves, abundant power, combined with great flexibility and economy of fuel.

Lubrication—Marmon automatic force-feed, direct to bearing surfaces through hollow crank shaft. Widely copied, but never equalled. Simple and reliable, reducing oil consumption and wear to the minimum.

The Most Practical Three Point Motor Suspension. Straight Line Shaft Drive. Improved Cone Clutch.

Transmission—Unit with rear axle. Simple, strong, easy of access.

Internal Expanding Brakes—Two sets on each rear wheel, 403 square inches of braking surface. Clean cut design. Accessible and effective adjustment. Acknowledged by official investigation the most effective of braking systems

Rear Axle—Marmon design and construction. Pressed steel housing, light, strong and durable. Accessible differential.

Left Hand Drive—With center control and every feature for safe and easy operation, making a car that a woman may drive with assurance—a car that may be trusted in any emergency.

Bodies—The individual design and finish of the Marmon "Thirty-Two" bodies add a distinctive tone of beauty and refinement. Distinguished in appearance they indicate the high character of every detail of the car. They are made with every care, of finest materials, fitted with every appointment and extra deep hand-buffed upholstery. The running boards are clean, with metal boxes for batteries and tools set in front fenders.

Equipment—Electric starting and lighting system; tailor made top with dust boot and curtains; built-in windshield, adjustable for ventilation, black and nickel finished; speedometer and clock combination; electric horn with button on steering wheel; electric light to illuminate entire dash; shock absorbers front and rear; single tire carrier rear and one extra demountable rim; coat rail; foot rest; full assortment of tools and electric extension lamp. Box in rear and compartments in tonneau provide ample storage space for curtains, tubes, pump, jack and other articles.

Prices—Five-passenger Touring Car, $3,000; Four-passenger Suburban, $3,000; Two-passenger Roadster, $2,900; Speedway Type Speedster, $2,850; Limousine (seats seven), $4,000; Landaulet (seats seven), $4,100; prices f. o. b. factory, Indianapolis, Ind.

"The Easiest Riding Car In The World"

MARMON

The Marmon "48" Seven-Passenger Touring Car

Price, $5,000. Six-cylinder, 48-80 h. p., 145" wheelbase, with short turning ability, eliminating the old objections to long wheelbase. Body types and equipment to meet every requirement. The only big car with small car advantages. Wonderful riding qualities and surpassing power and flexibility. A car developed by years of exacting tests.

ANNOUNCEMENT

The more a man knows about motor cars—the more he will appreciate the Marmon "Forty-Eight."

It is distinguished by its exclusive features as the most complete, luxurious and capable of all high-powered cars.

It has abundant power in proportion to weight. It combines small car ease of operation with the comfort and luxury of big car smoothness, flexibility and easy riding.

A few of the distinctive features of the Marmon "Forty-Eight."

Marmon "48" Motor—The finest example of modern motor construction—silent and free from vibration at from three to sixty miles per hour on high gear—tremendously powerful—wonderfully flexible and responsive. Six cylinders, 4½" bore, 6" stroke, two-spark dual ignition system, large valves, enclosed, silent chain connection to electric starter.

Lubrication—A further development of the famous Marmon automatic force feed, oiling system, used first in this country by the Marmon and proven successful by over ten years of service on Marmon cars. The oil is carried through hollow cam-shafts direct to the cam-shaft bearings, as well as through the hollow crank shaft direct to the main bearings, connecting rod and piston-pin bearings.

Three Point Suspension, Straight Line Shaft Drive, Multiple Disc Dry Plate Clutch.

Transmission, Rear Axle and **Brakes**—of proportionate size and following the same general design developed on the Marmon "Thirty-Two" and proved by the most strenuous tests of racing on track and road and in the hands of owners.

Front Axle—One of the many exclusive features of this distinctive car. The vertical spindle is placed in the direct, center line of the wheel. It makes the safest, surest and easiest steering mechanism ever devised. It permits this 145-inch wheelbase car to be turned in a remarkably short radius—gives you all the pleasure and comfort of big car operation combined with the advantages of small car ease of control.

Simplicity and Accessibility—No other high-powered car on the market offers such freedom from complication of mechanism—gives so many aids to sure, quick and simple adjustment of working parts.

Capability—In the design and manufacture of this car the underlying idea was to meet every requirement of the discriminating buyer, who after long years of motoring experience has come to the exacting point of knowing and demanding the best. The Marmon "Forty-Eight" is alike the car supreme on the fashionable boulevard or on the most tortuous road or hill that long-distance touring provides. In all-round capability no car can equal its records of performances.

Bodies—The low-hung, graceful Marmon bodies mark a new note in design, distinctly in advance of anything heretofore presented to the public. In the beauty of line, in the comfort of even balance, well proportioned springs and deep upholstery and in luxury of appointment and finish, they leave nothing to be desired. The appearance is enhanced by clean running boards. Ample storage space is provided for luggage and supplies.

Equipment—Electric starting and lighting system; extra quality tailor-made top with dust boot and curtains; new type windshield, designed as part of the dash with provision for abundant ventilation; speedometer and clock; electric light to illuminate entire dash; electric step light under tonneau doors; electric emergency lamp with long extension cord; electric horn, power tire pump, shock absorbers front and rear, tire carrier rear and extra demountable rim, coat rail, foot rest, full assortment of tools.

Prices—Seven, Five, Four and Two-Passenger Body Types, $5,000; Limousine (seats seven), $6,250; Berline Limousine (seats seven), $6,450; Landaulet (seats seven), $6,350; prices f. o. b. factory, Indianapolis, Ind.

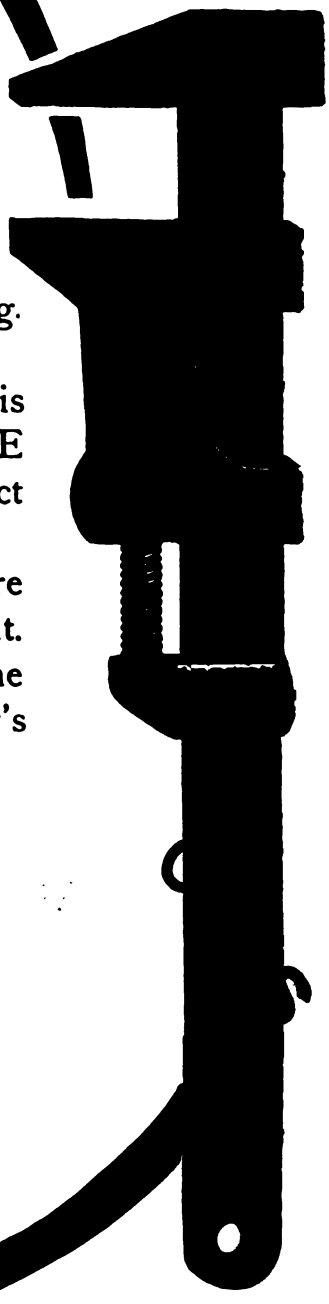
COES



THE
Wrench Supreme

Strength without bulk or clumsiness.
Ease of handling without slipping or bruising.
Perfect balance and right grip

Everything the motorist desires in a wrench is to be found in the "COES" AUTOMOBILE MODEL, and you will never know perfect wrench service until you pin your faith to it.

It stands to reason that the 5 per cent. more you pay for a "COES" wrench goes for 60 per cent. more quality and service—put this wrench in the tool kit and shop. You will get your money's worth.

Lyons-Knight

"THE CAR OF SILENCE"

$2900

The Proposition

Here in brief are a few of the many individual and distinctive features of this car—announced here for the first time. Every element of the Lyons-Knight car is the culmination of years of effort and test—the best that engineering brains, backed by the facilities and materials of ample capital, can afford. Judge these few points:

Outline Specifications

Engine—Lyons-Knight, four cylinder, four cycle, 4½ inch bore, 5½ inch stroke, water cooled.

Horse Power—50

Oiling—Lyons-Knight pressure feed to all bearings, pistons and sleeves regulated in accordance to engine power.

Carburetor—Improved double jet, especially designed, with adjustment on steering column.

Ignition—Dual, water-proof, high-tension magneto.

Clutch—Three plate, raybestos faced.

Transmission—Silent, selective, three-speed, sliding gear type embodied in rear axle housing.

Driving Gear—Worm drive, silent, smooth and always efficient in operation.

Rear Axle—Full floating, Timken bearings.

Brakes—Two sets, double acting, internal and external on 16" rear wheel drums.

Front Axle—Timken drop forged "I" Beam with roller bearings in steering heads and hubs.

Wheel Base—130 inches, tread 56 inches.

Wheels—Wood with quick detachable, demountable rims and 37 x 5 inch tires, front and rear. Wire wheels special.

Famous Knight Engine

During five years of successful use the Knight engine has proved its wonderful stability and endurance. Its famous test by the Royal Automobile Club, of four years ago, has never been equaled, either in the severity of the test or power delivered. In the International Sweepstakes 500-mile race at Indianapolis, May 30th, a Knight car finished fifth. It had the smallest engine in the race, having 250 cubic inches piston displacement against 448 cubic inches of the winner. It was acknowledged by far the quietest, smoothest running car on the track. Its record for economy in tires was remarkable. The water in the radiator registered 130 degrees at the start—130 degrees at the finish. It did not replenish either water, oil or gasoline during the whole race.

The Knight engine has proved in actual service, by the testimony of owners, that it becomes better, more powerful, more efficient, after 100,000 miles of operation.

Worm Drive

"Like continuous coasting," is the term used by one passenger to express the smooth, silent operation of the Lyons-Knight car.

Added to the silent, smooth-running Lyons-Knight engine is another great feature—worm drive.

The worm gear insures absolute freedom from noise, roughness, vibration and grinding. Reports of the Society of Automobile Engineers show that while more expensive to manufacture than other gears, it is the nearest approach to 100% efficiency in the delivery of power to the axle. It also becomes better with use—gives more power and efficiency year after year.

"The Car of Silence"

Because of:

Silent Improved Knight Engine,
Silent Worm Gear Drive Axle,
Silent Improved Electric Starter,
Silent Transmission,
Silent Chain for Engine Parts.

The really startling thing about the Lyons-Knight is its remarkable silence and absolute freedom from vibration. The most delicate woman or child can ride in it for hours at high speed without the slightest fatigue. Noise means excessive friction and wear, and is directly responsible for the fatigue experienced in motoring. All mechanical noises have been entirely eliminated in the Lyons-Knight—the quietest car built. We want you to compare this exceptional car in every detail of construction and equipment with the costliest imported and American cars.

We believe you will find it equally as good—and in the multitude of individual and distinctive features and details, superior. We think you will readily agree no such value has ever been offered among cars of the first grade.

Get the Details

Any description of the details that could be crowded into an advertisement would fail to do justice to the car, since so much would have to be left out. But in justice to yourself you ought to know them before investing $2,000 or $3,000 more than is necessary in purchasing a car that will meet your highest ideals in service, capacity and class. Nor is there any reason why you should be content with a medium grade car when the best is within the reach of every man of moderate means. It is worth your while to study the details of this very remarkable car.

Write for the Lyons-Knight catalogue today.

THE LYONS-ATLAS FACTORY

Including 65 acres, six hundred and twenty-seven thousand square feet of floor space, six miles of railroad with locomotives and cars, giving a capacity for fifty thousand Lyons-Knight cars a year and backed by ample capital to produce this number or more.

Lyons-Knight

"THE CAR OF SILENCE"

To Dealers

$2980

You—who have had experience—
Know the greatest argument for any good car are the facts.
We are not making empty promises about the Lyons-Knight car.
We want to give you facts!

Here Is What the Lyons-Knight Actually Gives

(1) A big, high-powered car, combining six cylinder smoothness, flexibility and efficiency with four cylinder economy.

(2) A car with more distinctive and individual features—of better design and quality than has ever been offered at $5000.

(3) Silent Knight motor, silent worm drive, giving absolute freedom from vibration, growing better with 100,000 miles of service.

(4) The most complete facilities for manufacture backed by ample capital, insuring prompt deliveries on all orders.

(5) A most aggressive sales policy, including a great national advertising campaign to make the Lyons-Knight first among high-class cars.

(6) A most liberal dealers' proposition backed by extensive local advertising and sales effort from the factory to help every dealer make greater profits from Lyons-Knight cars.

(7) A complete line including large and small four cylinder Knight cars, six cylinder Knight cars, and light and heavy commercial cars with Knight motors.

What more can you ask for in any car? If you have other requirements—ask about them. The Lyons-Knight proposition may include them also.

You can write us.
We can describe the many distinctive and exclusive features of this car.

The catalog will give you some idea of it.

Our dealers' proposition is most liberal from your standpoint.

But the best way to know the whole matter is to get the facts for yourself.

The Lyons-Atlas factory is a reality. The Lyons-Knight car is not an idea—but an accomplished fact—the cars themselves are ready for delivery.

Come—see for yourself.

Sell the car to yourself first.

View every part in the course of manufacture.

Compare facilities, design, materials and workmanship with what any other automobile factory actually offers.

Ride in the Lyons-Knight.

Judge if any car—at any price—offers so much downright motor car satisfaction.

Every experienced dealer that has come to the factory has been fired with enthusiasm by what he saw.

Already we have closed much important territory with the best established, most experienced dealers.

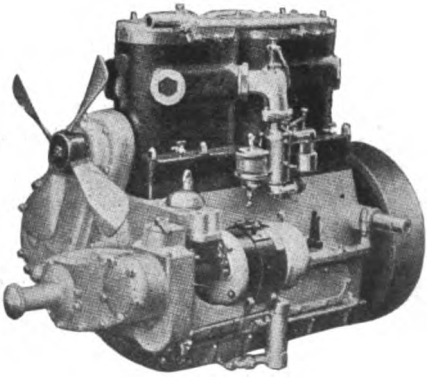
They have been quick to realize the big, profitable factors in this Lyons-Knight proposition.

This opportunity may still be open in your territory.

Write and we will let you know promptly.

Outline Specifications

Gasoline Tank—22 gallon capacity, on upper part of dash over toe board, giving gravity feed direct to carburetor.



Drive—Left hand with center control.

Bodies—Exclusive design, with maximum room and comfort. Sheet aluminum with extra deep, soft, hand-buffed upholstery.

Finish—Standard colors, dark blue and Brewster green, with black and nickel trimmings.

Equipment—Electric starting and lighting, with dash lamp and two-tone electric horn, patent one-man pantasote top with drop side curtains, special windshield with ventilator, dust cover, speedometer and clock, combination tire holder and trunk rack, two extra demountable rims, coat and foot rails, cocoa matting in tonneau and complete tool and tire outfit.

Prices—Five Passenger Touring Car, $2900; Seven Passenger Touring Car, $2980; Sedan Type, $3900; Berline Type, $4300; f. o. b. factory, Indianapolis, Indiana.

THE LYONS-KNIGHT ENGINE

This four-cylinder Knight engine actually gives the power, smoothness and flexibility of a six-cylinder poppet-valve engine of 50% greater displacement. Its many individual features make it superior in silence, smoothness, reliability, economy and power. Ask for actual proofs by test.

THE 8-DAY HIGH GRADE "CHELSEA" AUTO CLOCK

"SPECIAL"

"OFFSET"

"ROUND"

"LIMOUSINE"

Primarily intended for use inside the bodies of large enclosed cars, and for such use its case can be given a variety of fine finishes. It also makes an attractive clock for use on dashboards. Only made in 2¾-inch size.

The Justly CELEBRATED 8-Day, High-Grade "CHELSEA" AUTO CLOCK (*Trade-mark*)

NOW and for YEARS the RECOGNIZED STANDARD of EFFICIENCY

Clocks built with a view to stand the jars and jolts and rough riding of Automobiles. Reputation the highest. Used by parties demanding the BEST.

☞ ALL SIZES STATED ARE THE APPROXIMATE DIAMETERS OF THE DIALS.

All are 8-day High-Grade. All are in DUPLEX (patent applied for) polished cast brass cases, the most thoroughly waterproof case on the market. The "SPECIAL" clocks show dial on an angle; its inner cased clock, when removed from the outer (locked) case, is excellent for use on mantels, bureaus, etc., when touring; its outer case is screwed to dashboard by hidden screws. The "SPECIAL" clocks are in large demand from dealers for owners of finest cars.

The MOTOR CLOCK has the same clock movement which for years we have supplied for the hard use on Locomotives, Steam Fire Engines, etc.; its dial is of same appearance as the Auto Clock dial, but the Auto Clock movement has a somewhat finer train.

The 3¼ MOTOR "OFFSET" is likely to prove a quick, ready seller. Very attractive.

Ask for our new Auto Clock Circular and Price List, illustrating and pricing the above and three new models, C, D and E.

PRICE LIST (Per Clock)

		"Round"	"Offset"	"Special"	"Limousine"
"CHELSEA"	2¾-in. Auto Clock.....	$26.00	$28.00	$36.00	$28.50
	3¼-in. Auto Clock.....	28.00	30.00	45.00	Only made in
	3½-in. Motor Clock.....	24.00	26.00	41.00	2¾-inch size

If wanted fitted with outside (patent applied for) stem-winding and stem-setting device—the best of its kind—Add $3.00 to above Price Lists. (Such device we do not apply to the "Motor" Clocks or "Special" Auto Clocks.)

For Use on AUTOMOBILES and MOTOR BOATS

You want the Best? Ask your DEALER for the "CHELSEA"

THE STURDY STUTZ

MADE GOOD IN A DAY

Announcement of the Stutz Series E Cars—four and six cylinder

No radical mechanical changes—they were not necessary

The Stutz has been given every test anyone could ask or demand.

It has been sent up against all comers in the hottest races of the world. Racing is subjecting a car to every possible disadvantage in the shortest possible space of time. Out of such tests comes either a car or a memory.

Harry C. Stutz, designer of the Stutz, built his first car in five short weeks, and it finished the first 500-mile race at Indianapolis without even a mechanical adjustment, and jumped into fame over night.

The Stutz is a car of fundamentals which embodies known, tested and proved principles of motor car building and motor car service.

Stutz Features

A Digest of the Pecrs

1 Dependable Electric Starter
2 Lighting System—Remy electric generator with storage battery
3 Cone Clutch
4 4¾x5½ T-head motor in 4-cylinder models; 4x5 T-head motor in six-cylinder models
5 Stutz special rear system
6 Timken front axle
7 Gemmer steering gear
8 Force feed oiling system through hollow crank shaft
9 Tires 34x4½
10 Black and nickel trimmings throughout

Stutz Cars are made in both four and six-cylinder models.

New models now ready

While we have not made any radical changes—they were not necessary—still we found it possible to add a few more refinements and conveniences—making these new models even more desirable than the previous Stutz cars.

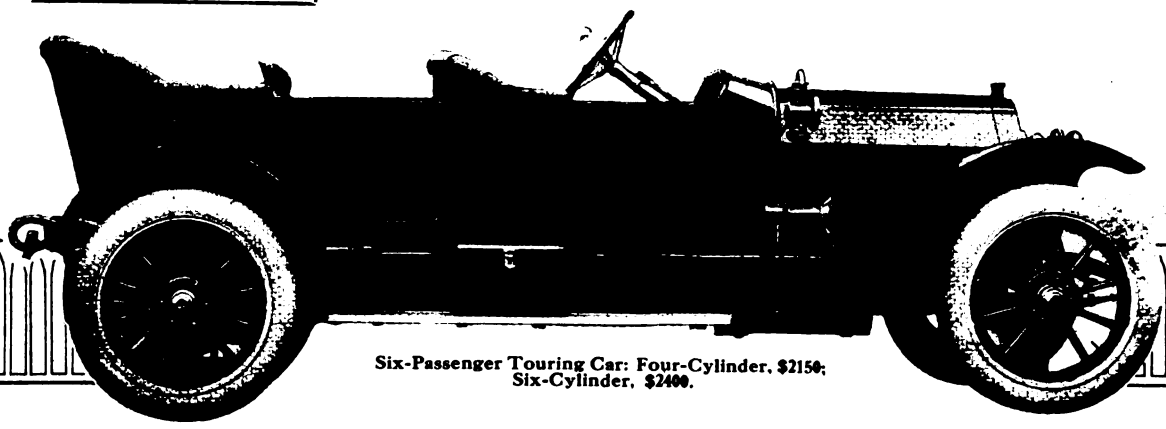
For instance, the bodies of the touring cars are larger, roomier, and even more comfortable than heretofore. The upholstering will be generally more luxurious, and the springs a little longer.

The electric starting, lighting and ignition systems employed in the Stutz are separate units, thus eliminating any chance of complication. The self-starter is so simple that a child can understand it. It works quietly and certainly. Electrical experts regard our installation as the simplest, and therefore the best, on the market.

All the special Stutz features that insure strength, speed, sturdiness, ease of operation, have been retained.

Financial responsibility back of the Stutz

Back of the Stutz car is an institution that is substantial, solid and financially responsible.



Our method of manufacture, as well as the sales distribution, has ever been safe, sane and economical—always with the idea of giving each Stutz owner full measure for his money.

If you are in the market for a car let us know and we will put you in touch with the nearest Stutz dealer—and also send you our new Series E catalog, No. A-5.

There are a few points where we are not now represented. We invite correspondence with responsible dealers.

Cartercar

A good car for owners—
A good car for dealers!

A dealer who can send out cars with a certain knowledge that those cars are going to make good—every time—is going to build up a prosperous and permanent business.

And this is exactly the reason why the Cartercar has so many unchanged agencies today. Every Cartercar owner becomes a part of the dealers' selling organization.

A Cartercar gives the owner full value for every dollar he invests. He finds it all that he can possibly ask for in his car. His wife can drive it—his entire family is safe in it.

This is the car with the gearless transmission—which without any gears at all—must be far more reliable than a complicated gear transmission.

You have unlimited speeds—power to climb steep hills—to go through deep mud and and sand—and it will give this service continually without any trouble whatever.

Right there is the big advantage of owning a Cartercar. You can give it hard wear, the hardest wear possible, and there is nothing to strain or break. Of course, nothing will break, when there is nothing to break.

And another feature of the Cartercar which places it far above the gear car is the elimination of jerks and jars in starting and changing speeds.

This means about twice the usual tire mileage—and you can see that it will reduce your upkeep expense on all parts.

The Cartercar does things. It may look similar to other cars as it stands on the salesroom floor, but when you get it out on the road, you immediately realize the great difference.

Once a Cartercar owner—always a Cartercar owner—means once a Cartercar dealer, always a Cartercar dealer.

If we are not represented in your territory we would be pleased to hear from you. Perhaps you are the man we want to handle the Cartercar. Write us today—this is the biggest season the Cartercar has ever had—and we are getting inquiries from all over the country—probably from right near you.

Do You Want To Double Your Tire Mileage?

That's what you will do if you ride on wire wheels instead of on wooden wheels. There are many reasons why the car owner who is looking for the utmost in motor car construction should insist upon wire wheels—such as ease of riding, ease of steering, lengthening of the life of the car itself, etc.—but the prime essential of all these considerations, obviously, is the fact that wire wheels increase the life of the tire anywhere from 25 to 50% or more.

By actual tests conducted over a period of six months, a saving of 68.75% was shown by the use of wire wheels compared with wooden wheels under exactly similar conditions.

Wire wheels save tires because they are light at the periphery, thereby reducing the road pound at point of contact. Wire wheels also radiate external and internal frictional heat which is held in the wall of the tire by wooden wheels because of the non-heat conductivity of the wooden bands.

If you are interested in this all important subject, write us for further details.

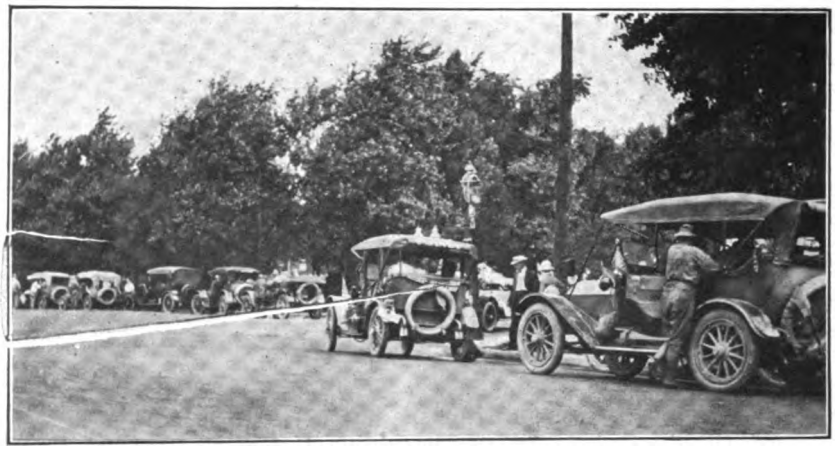
THE AUTOMOBILE JOURNAL

VOL. XXXV, No. 12 JULY 25, 1913 Price, $1.00 the Year

HOOSIER TOURISTS ENTER NEVADA.

Cloudburst in Utah Delays Party One Whole Day---New Trail Blazed from Price to Salt Lake City---Steep Grades Over the Continental Divide in Colorado Surmounted Without Any Serious Difficulty.



WHEN last heard from the representatives of the Indiana Automobile Manufacturers' Association, en route from Indianapolis to the Pacific Coast, had left Salt Lake City, Utah, and were about to enter that section of Nevada in which postoffices and telegraph stations are few and far between. Advices from Salt Lake City indicate that the tour has been an unqualified success in every particular, and although one whole day was lost in Utah, this will not affect the schedule materially. There seems no reason for believing that they will not reach San Francisco on time July. 27.

Cars on the Indiana Automobile Manufacturers' Association's Transcontinental Tour in Front of the State Capitol at Denver.

The five hours of rain, to which the tourists were subjected on their start from Indianapolis, July 1, was prophetic of that heavy downpour, or cloudburst, which greeted them between Thompsons and Green River, Utah. Seven cars were forced to return to Thompsons for the night, while others were reported stalled all along the way, to Green River. However the story is best told in chronological order. The heavy rain of that first day had its effect upon road conditions throughout the State of Illinois, but after leaving St. Louis, the two days in Missouri were devoid of special incident, insofar as the tour itself was concerned. Besides the flag presented to the pilot car by Lieut.-Gov. O'Neil of Indiana at the start, two more were acquired before reaching Kansas City—one being presented by Gov. Dunne of Il-

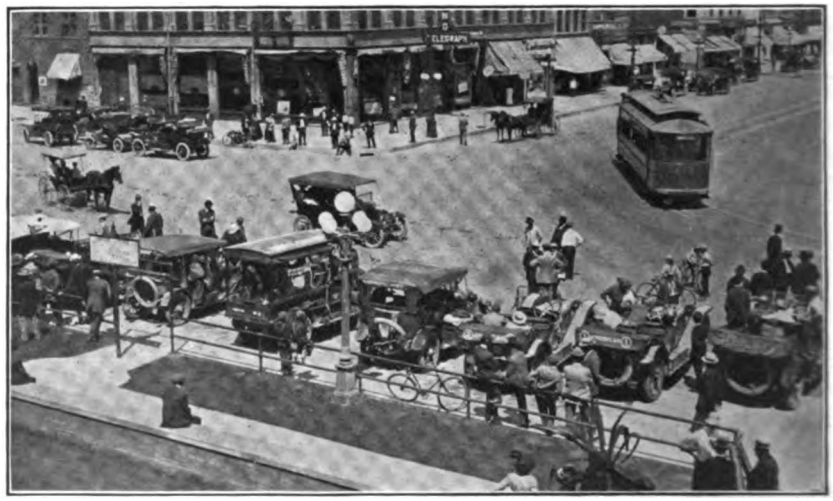
Leaving St. Louis on the Morning of the Fourth of July, Empire 19 in the Foreground.

linois at Springfield and the other by Mayor Keil, on behalf of Gov. Major of Missouri, at St. Louis.



The Fourth of July was fittingly celebrated at Columbia, Mo., where the Columbia Club greeted the tourists with open house. C. E. Branston, a member of the Institute of Automobile Engineers of Great Britain, who remained behind at the close of the recent official visit of that organization to America, in order to take part in this tour, was invited to make a speech suitable for the occasion and did so. Of course, the proposed Lincoln ocean-to-ocean highway was the chief topic for discussion, as it has been at all such formal occasions throughout the entire journey. Sunday, July 6, was a day of rest in Kansas City.

Gov. Hodges of Kansas joined the party at Topeka and accompanied the tourists across the state, speaking in the interests of good roads and the Lincoln highway wherever opportunity afforded. Instead of stopping at Fort Riley, Kan., as originally planned, the night stop, July 7, was made at Junction City. Gov. Hodges occupied a seat in the Empire this day, which was still running on Indianapolis air. The first water was put in the radiator at Kansas City.

Still following the Golden Belt route, the tourists found the day's drive from Junction City to Ellis, Kan., one continuous climb. For that matter Junction City is 1300 feet higher in altitude than Kansas City, but Ellis adds still another 1000 feet. This fact is particularly worthy of note inasmuch as the Pathfinder entrant was running under a sealed bonnet, and although the day was the hottest thus far encountered, the hood was not lifted during the 180 miles. None of the cars found it necessary to make carburetor adjustments, in spite of the change in altitude, and Ray Harroun reported his Henderson, utilizing a Harroun kerosene carburetor, as still working satisfactorily. One feature of the day's journey was the request made by county commissioners at Kanopolis that members of the party address the people on the subject of good roads. At Hays, the local newspaper issued a special edition on the tour, copies of which were presented to the Hoosiers five miles out of town.

At Ellis, the first night was spent under the tents, carried strapped to the cars since leaving Indianapolis. During the night a terrific storm came up and the guards had been posted hardly in time to prevent some of the 75 campers receiving a severe drenching. Burlington, Col., was the next night stop, and here again the tents were brought into play. A delegation from the Denver Chamber of Commerce met the tourists at this point, in the interests of the Midland trail, bringing with them a number of cowboys, who took charge of the cooking tent during the stay in that city.

From Burlington the party went to Colorado Springs, stopping at noon in Limon. The people of Colorado Springs had prepared a pro-

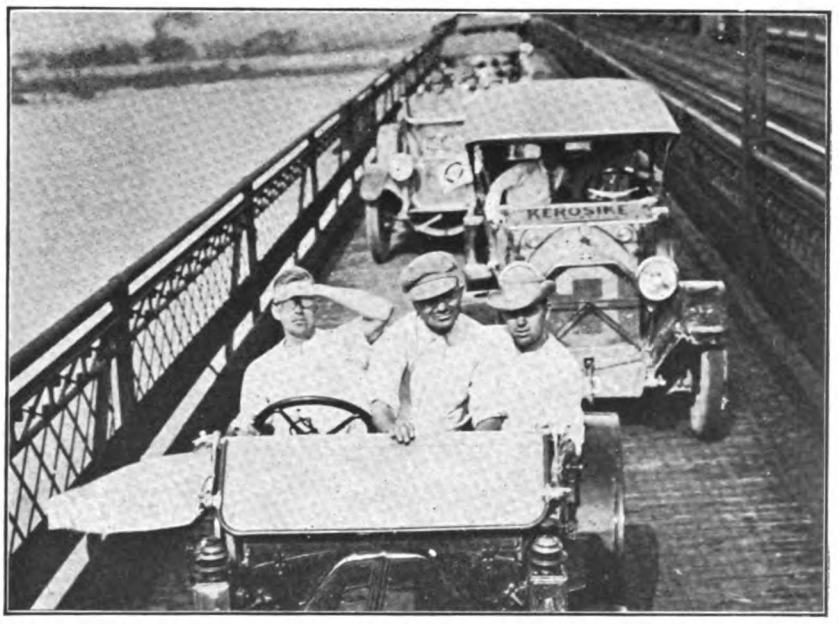
American and Empire Entrants About to Take the Ferry on the Way to Booneville, Mo.



gramme that would have taxed the energies of the visitors during a longer stay, and much of it had to be neglected. Time was taken during the morning of July 11 to visit the Garden of the Gods, Crystal park and the Ute pass. This last named run was made in local cars, with the exception of Ray Harroun, who desired to test his kerosene carburetor in that altitude, which is said to be 11,000 feet. He reported that his machine showed better results than those equipped with gasoline vaporizers, due, as he expressed it, to the lower vaporization point of the fuel and the decreased atmospheric pressure.

The 69.2 miles between Colorado Springs and Denver was made during the afternoon, under an escort composed of members of the Denver Chamber of Commerce, the Denver Motor Club and the Colorado Automobile Club. On the steps of the capitol building, Gov. Ammons presented the tourists with the fifth flag, Gov. Hodges having left his when he bade the tourists farewell at the Kansas-Colorado line. The chief social event of the day was the luncheon tendered by the Midland Trail Association, at which the subject of good roads and the Lincoln highway were again the topics for discussion.

At Denver it was learned that the Fallon Sinks, near Fallon, Nev., were filled with water, due to the recent heavy rains, and that it would be necessary to change the original schedule somewhat. It was decided to go direct from Ely, Nev., to Tonopah, Goldfield, Bishop and Lake Tahoe, eliminating Austin, Reno and Carson City. The new route is a trifle longer than the other, but it was believed possible to make it in the three days allotted for this portion of the trip. Word also was received at this point from President Laurens Enos of the American Automobile Association and A. G. Batchelder, chairman of the A. A. A. executive committee, then with the so-called Glidden tour in Montana, that they would join the Hoosier party at Lake Tahoe.

Leaving Denver Sunday morning, July 13, the party soon appreciated that the hardest part of the task lay before it. To Golden, 14 miles of good gravel road was encountered and no difficulty was experienced. Just beyond Golden, the widening road, known locally as the "hogback," took the tourists up Mt. Vernon canyon. While the grade is about six per cent., the surface is of red sandstone and offered little trouble. Thirty miles out, at the top of Floyd hill, the water in the radiators was boiling, although the motometers showed a temperature of 185 degrees. For the first time it became necessary to make carburetor adjustments.

A fine example of road building was found on the opposite side of Floyd hill, and while the grades are from six to seven per cent. in places,

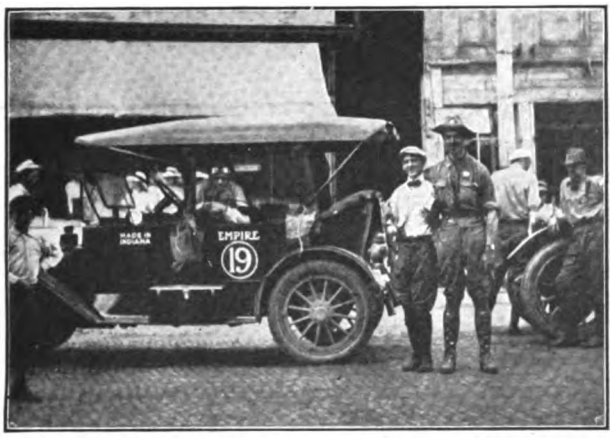
Pilot 20 Acting as Pacemaker from St. Louis to Columbus on the Fourth Day of the Tour.

all dangerous spots are well guarded with heavy cable. Idaho Springs was reached along a winding canyon road, and here the tourists were welcomed by a brass band. Then for 15 miles the way wound up and down along the river through the mining towns of Dumont, Lawson and Empire. Just beyond Empire is Berthoud pass, over which the Continental Divide was crossed. In four miles the cars climbed 3000 feet, the last 1000 feet being covered in one mile. Some of the grades are as high as 20 per cent., and the altitude affected the power of the motors very materially. Most of the cars were unable to make the grade with load and in several places the passengers were forced to aid. One machine climbed the pass on the reverse. The view from the top of the pass was such as to repay for the extra exertion. The ride down the other side was sufficient to offer tests quite as effective as the upward climb. Sharp turns, steep grades with a cliff on one side and a drop of thousands of feet on the other, narrow roads just wide enough for one car, with turnouts at frequent intervals, made a steady hand and good brakes decidedly essential, although the roadbed was in excellent condition. Then came Sulphur Springs, the night stop.

The 107 miles between Sulphur Springs and Glenwood Springs was through canyons practically all of the way. Much of the road work was new, and crews were at work as the tourists passed. A feature of the day's trip was the journey through Gore canyon, which presents views frequently compared with those to be found in the Alps.



Next came the 110-mile run from Glenwood Springs to Grand Junction, through the canyon of the Grand, with its narrow roads along precipitous cliffs, convicts still working on them. Then, after several miles of desert country with no signs of life except coyotes and gophers, and with painted cliffs all around, the way lead into one of the greatest fruit raising countries in the world. From Palisades, in the midst of this fruit section, to Grand Junction, the route was a boulevard lined on both sides with orchards.

At Grand Junction, practically half of the entire journey, as originally laid out, and as amended at Denver, had been covered. The Continental Divide had been crossed, and some of the highest altitudes of the trip had been reached. All but one of the cars arrived on schedule time, the delinquent being the Brown internal gear driven truck, carrying tire equipment. That this machine had been able to accompany the pleasure cars over the steep grades and high altitudes was conceded to be a feat never before realized. It expected to join the tour a little later, although

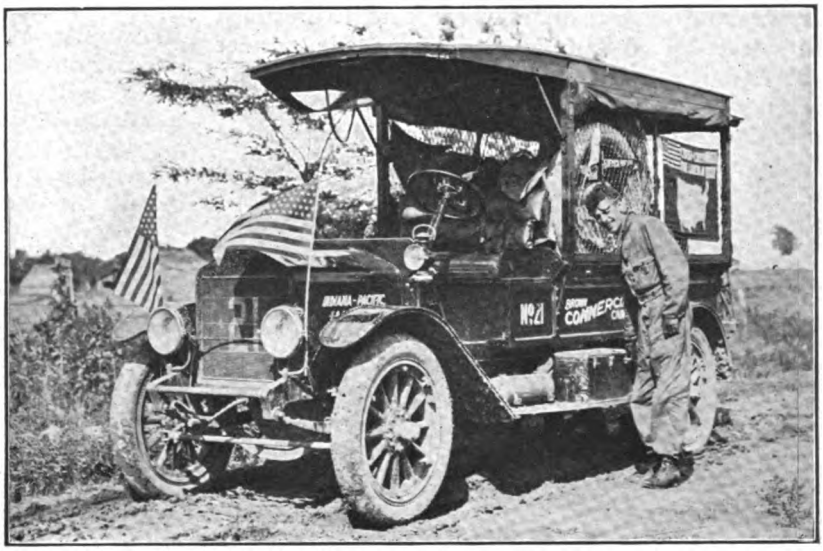
Harlow Hyde, Empire Advertising Manager, and One of the British Engineers on the Tour.



it was reported as having been delayed somewhere in the mountains.

Wednesday, July 16, the tourists left Grand Junction for Green River, Utah, on the way to Salt Lake City. All went well until Thompsons had been passed. Suddenly in the midst of the desert a local cloudburst turned the roads, such as they were, into deep mud. Some of the leaders had passed the danger point, but the storm caught the rear end of the column and a few of the machines that did get through were reported as stalled on the way to Green River. The Empire, Pathfinder, McFarlan, Pilot and Premier truck, the last named carrying tires, with two cars that had joined the party at Denver, decided it the better part of wisdom to return to Thompsons for the night. So far as could be learned there were no accidents, but the condition of the road was such as to make impracticable an attempt to reach Green River until morning.

The delay seriously affected the schedule during the remainder of the distance into Salt Lake City, but fortunately it had been arranged to spend a whole day in the Utah capital. All of the contestants succeeded in reaching Green River Thursday morning, after which it was decided to proceed as far as Price that day. At 6 Friday morning, the party left Price over the new road through the mountains. It transpired that the Hoosiers were the first motorists to make the trip over this road, which for five miles is high on the mountain side, very narrow, with many windings, and in several places decidedly steep. Travel was slow most of the time, but the last car arrived in Salt Lake City at 5 in the afternoon.

The cars making the trip are as follows: American 1 and 2, American Motors Company, Indianapolis; Henderson 3 and 4, Henderson Motor Car Company, Indianapolis; Stutz 5 and 6, Ideal Motor Car Company, Indianapolis; Marion 7 and 8, Marion Motor Car Company, Indianapolis; Premier 9 and 10, Premier Motor Manufacturing Company, Indianapolis; Haynes 12 and 13, Haynes Automobile Company, Kokomo; Pathfinder 14, Motor Car Manufacturing Company, Indianapolis; McFarlan 16, McFarlan Motor Car Company, Connersville; Apperson 17 and 18, Apperson Bros. Automobile Company, Kokomo; Empire 19, Empire Automobile Company, Indianapolis; Pilot 20 and 21, Pilot Motor Car Company, Richmond; Marmon 22, Nordyke & Marmon Company, Indianapolis; Brown tire truck, Brown Commercial Car Company, Peru; Premier tire truck, Premier Motor Manufacturing Company, Indianapolis.

The Miller Rubber Company, Akron, O., makes public the fact that the information previously given by it relative to Verbeck winning the Los Angeles-Sacramento road race in a Fiat car equipped with Miller tires, was incorrect. Verbeck uses Miller tires as regular equipment, as does Tetzlaff, and he intended to drive Miller shoes in the road race referred to. Owing to delay in transportation, however, he was compelled to drive the race with tires of another make.

METZ TEAM WINS GLIDDEN TROPHY.

Small Cars Outclass Larger Machines in National Reliability Tour Across North Dakota and Montana—Chain Driven Locomobile Takes New A. A. A. Cup.

TO THE Metz team goes the honor of winning the famous Glidden trophy in the ninth national reliability tour of the American Automobile Association, which came to an end in Glacier national park, Montana, Saturday, July 19. The new A. A. A. trophy, which was substituted for the Glidden award in the touring car class this year, was won by a chain driven Locomobile, driven by Dr. J. D. Parks of Duluth, Minn. The Anderson trophy for runabouts, presented by the citizens of Anderson, S. C., in 1911, was awarded by lot, the decision resting between the three Metz cars, the two Hupmobiles and a K-R-I-T. The drawing was in favor of the Hupmobile No. 15, driven by C. Munzer. Hupmobile No. 14, driven by W. W. Munzer, retains permanent possession of the Minneapolis Daily News trophy, this having been won by a Hupmobile last year in the Minneapolis to Winnipeg tour.

The performance of the Metz team was most noteworthy. The three little 22.5 horsepower, friction driven cars from Waltham, Mass., went through the entire journey from Minneapolis to the Glacier national park without a mark. It was the only team of three cars to perform this feat. Two Hupmobiles also made perfect scores, but there were only two cars in the team. It may be stated that in all respects the smaller machines showed up to much better advantage than the larger in this test. And that it was a test worthy of the best efforts is borne out by the fact that the roads across North Dakota and Montana are far from being ideal in any respect.

RECORD OF GLIDDEN TROPHY.

Year	Route	Miles	Victor
1905	New York—Bretton Woods—New York	871	Pierce
1906	New York—Buffalo—Bretton Woods	1135	Pierce
1907	Cleveland—Chicago—New York	1570	*
1908	Buffalo—New England—New York	1670	†
1909	Detroit—Kansas City	2533	Pierce
1910	Cincinnati—Southwest—Chicago	2851	Chalmers
1911	New York—Jacksonville	1454	Maxwell
1913	Minneapolis—Glacier Park	1233	Metz

*Won by team representing Automobile Club of Buffalo, composed of two Pierce-Arrows, a Thomas and a Packard; †no award made. There was no tour in 1912.

Twenty-seven cars left Minneapolis, July 11, for the 1233.1-mile journey across the states of Minnesota, North Dakota and Montana to the gateway of Glacier national park. That is to say, there were 27 cars scheduled to leave. L. W. Hill's Packard, which had been listed as contestant No. 1, failed to appear at the start and followed the rest three hours later. It caught up with the remainder of the party in Alexandria. The official contestants are given herewith in tabulated form, and besides these there were a Packard, Moon, Ford, Chalmers and Premier as noncontestants, a Mitchell pilot car and the president's car, a Winton.

During a larger portion of the first two days the tourists were compelled to make their way in drenching rain. This did not have a tendency to improve the roads, which are none too good in the section covered by the tour, even under ideal weather conditions. It will be noted, from the accompanying score, which is made up from the information contained in the Glacier Park Blazer, a newspaper printed on the official train accompanying the tourists throughout the journey, that most of the penalties were awarded during these three days. As was true of the national tour in 1911, when the route lay from New York City to Jacksonville, Fla., penalties were for being late at controls only.

The first day's run was from Minneapolis to Alexandria, Minn., a distance of 144.4 miles, with noon control at St. Cloud. The pilot car made the 65 miles between Minneapolis and St. Cloud

in 3:05:00, and L. H. Fawkes in a Premier was the first contestant to arrive. About 13 miles east of Alexandria the pilot car and the Kissel-Kar entrant became ditched because of the heavy mud. The Stutz picked up the official flags and made the night control in advance of all others.

The second day took the tourists to Fargo, N. D., with noon stop at Fergus Falls, Minn. The distance for the day was 123.8 miles. Near Osakis, the enterprise of the Minnesota farmers was decidedly evident, several of them being ready with horses to pull machines from the swamp at $5 a pull. It was during this day that suggestion was made that one of the Metz machines be attached by a 40-foot rope to the pacemaker, so that there should be no delay in extricating it from the mud. At one point it looked as if one of the Munzer twins, in the Hupmobile team, would lose his perfect score, being halted for a time with a puncture. At night one lone point was credited against him, but upon checking up the watches of the party the figure was erased. The Marmon was the first to reach Fergus Falls, with the Stutz a close second. At Elizabeth, P. C. Frazee, in a 1909 Cadillac, volunteered to show the tourists a way to reach Fargo that would eliminate some of the mud, and guided the party to Moorhead.

Sunday was a day of rest, in Fargo, and the tourists appreciated the innovation. During the day the skies cleared and when the party left at 6:30 Monday morning it was with a feeling that much better time would be made under the changed conditions. But the roads to Devils Lake, 194.6 miles, with noon control at Grand Forks, were found to be in such condition that President Enos suggested substituting life buoys for confetti in marking the route. The Marmon brought the pacemaker's flag into Crookston, after several of the cars had been delayed, but from Crookston to Grand Forks there were no mishaps. Near Eldred, a horse that had been turned out to pasture along the roadside became frightened at the calvacade and ran down the highway ahead of the tourists, scattering the confetti to the four winds. At Grand Forks, Fred Bartholomew, in a Luverne, joined the party, intending to go only so far as the Montana line.

The run from Devils Lake to Minot, a distance of 135.6 miles, was covered under excellent touring conditions. The noon control was at Rugby. Beyond that town and through Towner, Donbeigh and Granville, the machines actually left a trail of dust behind them. At Rugby the tourists were met by a large delegation of local motorists and a brass band, and a large body of Minot owners was at Granville to escort the party over the last 10 miles of the day. At Halstad the tourists drove through an immense horseshoe.

The Team of Three Metz 22.5 Horsepower, Friction Driven Cars, Which Captured the Glidden Trophy in the Ninth National Reliability Run.

Much the same conditions prevailed on the sixth day, between Minot and Williston. The 136.8 miles, with noon control at Stanley, were covered practically without incident. The date was made somewhat notable by the arrival of L. W. Hill, president of the Great Northern Railway, who was largely responsible for the selection of this route for the 1913 tour and for the official train, carrying the hotel equipment for the tourists. It was made particularly evident this day that contests of this character have a special value to the territory covered by them. Practically every farmer's boy on the route was able to call off the names of the different machines, indicating familiarity with the distinguishing features of each. It was freely noted among the contestants that the boy of today is the buyer of

Digitized by Google

automobiles tomorrow, and events of this character do much to bring the merits of the various cars to the attention of the public.

The seventh day took the tourists from Williston to Glasgow, Mont., a distance of 163.8 miles, with the Metz team bringing the pacemaker's flag into the noon control at Poplar, Mont. The steep hill about eight miles west of Williston was negotiated with ease, although the contestants had been freely warned as to its peculiarities, with winding turns at the bottom of some of its steepest portions. At Buford a brief stop was made to inspect the spot made historic by Custer's last charge. At the Fort Peck reservation the survivors of the tribe which massacred Custer welcomed the motorists, and entertained them for a time with Indian dances, horse races and a sham battle. With exception of the Marmon entrant, which was withdrawn, all cars came through the day with perfect scores to their credit.

The Metz Twins, the Misses Irene and Lillian, in One of the Glidden Trophy Metz Cars.

The run from Glasgow to Havre, 156.1 miles, with noon control at Malta, offered some decided innovations, in that the way led up hill and down dale with a number of dangerous places to be encountered. From a point 120 miles west of Glasgow to Harlem the roads were filled with stones, and great care in driving was necessary, as gulleys and ruts added their hazards as well. From that point into Malta the surface was good and fast time was possible. In the vicinity of Yantic a number of bad turns occupied the attention of the contestants until within five miles of Havre.

The last day's journey was much in the nature of a triumphal parade, for such cars as were still to be listed in the perfect score division. The Blackfeet Indians were encamped at the gateway to the park reservation as a committee of welcome. Early in the evening the Rocky mountain peaks were illuminated with Roman fire, and all told no previous national reliability tour of the American Automobile Association had a more spectacular finish.

The Metz is the product of the Metz Company, Waltham, Mass. It has a four-cylinder, water-cooled motor, cast en bloc, with bore of 3.75 inches and stroke of four. Lubrication is by the constant level splash system, the level being maintained by a pump. Cooling is by the thermo-syphon system. Ignition is by Bosch high-tension magneto. The carburetor is of the float feet automatic type. The clutch is a friction plate applied to the driving ring, the drive being by friction discs with chains running in oil. The springs are full elliptic all around. Two sets of brakes are fitted, internal expanding on rear wheel drums and external contracting on jack-shaft. The wheels are of the artillery type, fitted with 30 by three-inch tires. The driver is placed at the left with centre control levers.

Too much credit cannot be given the Metz team for winning this famous award, which for the past eight years has been a coveted possession to be displayed at the annual shows and on all other prominent occasions by the winner. The trophy was donated by Charles J. Glidden early in 1905, soon after the completion of the first national reliability tour. With two exceptions, it has been awarded annually since that time. An accompanying table gives the names of the cars which have held it. In 1908 three teams were tied in the final score and it was arranged to run off the tie at a later date. But one of the teams appeared and this refused to cross the starting line, so no award was made. There was no tour in 1912.

According to the Glacier Park Blazer, the Locomobile driven by Dr. Parks had a record of more than 100,000 miles before it entered the tour. No mention was made of the date of its production, but it was a chain driven model, and the Locomobile Company of America, Bridgeport, Conn., stopped making chain driven cars in 1909. At the beginning of the tour in Minneapolis, Dr. Parks said: "I'm going to show the old Bridgeport Lion the wonders of Glacier park. It has seen about everything else in the country." It appears, however, that it was to show some of the later day models a thing or two as well, bringing back the new A. A. A. trophy.

The Motometer Company, 1790 Broadway, New York City, has received the following cablegram from Boillot and Goux, winner and second place driver in the French Grand Prix: "Your motometers mounted on our cars have given us complete satisfaction."

WINNERS IN ALPINE TOUR.

Rolls-Royce of English Make at the Head of Perfect Score Class in Austria.

Nine cars finished the recent 1654-mile Alpine test of the Royal Automobile Club of Austria with perfect scores. Five others were without penalization at the completion of the run, but suffered demerits in the technical examination. Cars representing eight nations competed.

Those which were perfect in all respects were: Rolls-Royce, C. C. Friese; Minerva-Knight, E. Guidenus; Horch, G. Paulmann; Laurin-Clement,, O. Heironimus; Benz, W. Delmar; Audi, Lange; Audi, A. Granmuller; Audi, L. Obruba; Raba, Sirutschek. The five which finished the road work without penalization were: Minerva-Knight, G. de Long; Horsch, Dr. Stross; Laurin-Clement, Count Kolowrat; Puch, Miss Helene Morarin; Fiat, M. Schneeweiss.

CYCLECARS IN GRAND PRIX.

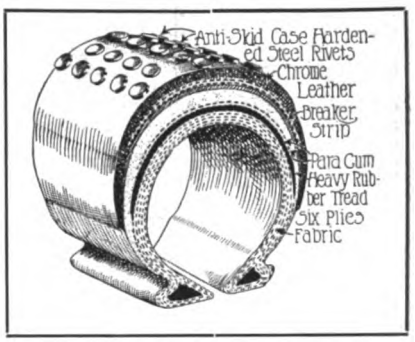
Bedelia Wins in Event for That Class and Morgan in Side Car Division.

While the results in the French Grand Prix for automobiles is given elsewhere in this issue, it appears that subsequent to that event a race for cycle cars was run in two divisions over the same course, the distance being 145 miles. The cyclecars were divided between four-wheel and three-wheel machines, the latter being termed sidecars, although some of those entered, the winner for instance, were of a design more nearly resembling the so-called tricar.

In the regular cyclecar division, a Bedelia model, Bourbeau driving, won, covering the distance in 3:55:54, or at a speed of 41.2 miles an hour. Second place went to Camouel in a Sphinx, time, 4:05:11, and third to Rontelx in a Rontelx, time, 4:11:16. The side car division winner was McMinnies in a Morgan, the time being 3:53:09, or at a speed of 42.8 miles an hour.

ERECTS FACTORY ADDITION.

New Structure Will Triple Capacity of Ward Leonard Electric Company.



The Ward Leonard Electric Company, Bronxville, N. Y., has been so successful with electric lighting and starting equipment for automobiles and orders have increased to such an extent that it has been necessary to build an addition to its plant. This increase is to the northeast wing of the factory and work on it is rapidly nearing completion.

The new building will greatly facilitate the company in handling the additional business and will enable it to triple its present output. The present congestion in the installation department will be relieved.

INVINCIBLE PUNCTURE PROOF TIRES.

Old Shoes Rebuilt and Guaranteed Against Blow-Outs or Punctures.

Blow-outs and puncture are the natural outcome of the tire equipment, the latter being possible even with a new shoe. Usually the worn out casing is scrapped, obtaining a small sum. By the Invincible process, which includes completely rebuilding the old casing, it is held that not only is the tire made as good as new, but the maker gives a guarantee of 3000 miles service without a puncture or a blow-out.

Invincible Puncture Proof Tire.

An accompanying illustration indicates the process and it will be noted that in addition to the conventional plies of fabric and rubber tread, there is added a breaker strip to which is cemented pure Para gum. Applied to this construction is a layer of French chrome leather which is secured permanently by a special cementing process and vulcanized, making it integral with the regular shoe. At the point where the greatest stresses are experienced are other layers of special leather. The tread of the shoe is studded with case hardened steel rivets which provide non-skidding features and which are guaranteed not to break from the surface.

The maker states that heating is reduced to a minimum because the leather, fabric and rubber are cemented together, and that the leather is a non-conductor of heat. Punctures are prevented by the leather, which, as it will be noted practically envelopes the tread and side walls. The Invincible Tire Company, 53 Sabin street, Providence, R. I., issues a valuable booklet on tires, which will be mailed free to anyone interested, upon request.

GENERAL NEWS OF THE INDUSTRY.

Important Convention of Parts Makers at Factory of Cole Company in Indianapolis---Centralized Sales Plan of Chicago House---Changes in Personnel.

A MEETING of many of the most representative men in the automobile industry was held in Indianapolis, Ind., July 17, to discuss what was termed the new standardized type of automobile. The convention was called at the request of President J. J. Cole of the Cole Motor Car Company, and its object, as outlined by him, was to ascertain how best to scientifically handle the problems of volume and overhead, with the idea in mind of increasing the quality of the motor car and at the same time reducing its cost to the user. The companies represented included the following:

Timken-Detroit Axle Company, Detroit; Northway Motor & Manufacturing Company, Detroit; Mayo Radiator Company, New Haven, Conn.; Gemmer Manufacturing Company, Detroit; Timken Roller Bearing Company, Canton, O.; Dayton Engineering Laboratories Company, Dayton, O.; Detroit Steel Products Company, Detroit; Spicer Universal Joint Manufacturing Company, Plainfield, N. J.; Hydraulic Pressed Steel Company, Cleveland, O.; Firestone Tire & Rubber Company, Akron, O.; Stewart-Warner Speedometer Corporation, Chicago; Stromberg Motor Devices Company, Chicago; Janney, Steinmetz & Co., Philadelphia, Penn.; Curtain Company, Jackson, Mich.; Taylor Tire Pump Company, Chicago.

Cole representatives were present from New York, Boston, Brooklyn, Newark, Sioux City, Spokane, Toronto, Winnipeg, Vancouver, Washington, El Paso, Butte, Baltimore, Atlanta, Birmingham, Mobile, Buffalo, Chicago, Cleveland, Dallas, Denver, Des Moines, Detroit, Jacksonville, St. Louis, Los Angeles, San Francisco, Kansas City, Louisville, Little Rock, Memphis, Minneapolis, Omaha, Philadelphia, Portland, Me.; Portland, Ore.; Seattle, San Antonio.

Homer McKee, director of sales and advertising for the Cole Company, presided at the meeting and in his opening remarks he defined the proposed Cole economic standardization as the science of employing the factors of volume and overhead for the purpose of increasing quality and decreasing cost. As applied to the motor car he said that standardization meant building exclusively of nothing but recognized standard units. A standard part is any part which has been built so well that it has become the standard whereby all similar parts are measured. The various concerns represented produce what Mr. McKee termed the best in their respective lines and he said that the Cole machine was the first to conceive the idea of placing these various parts into one, compact vehicle. He was certain the movement was an epoch making one and that when the details could be worked out to the satisfaction of all and each was working in harmony and conjunction with the others, the results would be beyond computing.

PURCHASES MACO CARBURETOR.

New Concern Will Continue Its Production in New Location.

The Gleason-Peters Air Pump Company, Brooklyn, N. Y., announces that it has purchased the business recently owned by the Motor Appliance Company of America, maker of the Maco carburetor.

The business has been transferred by the Gleason-Peters company to its present plant at 255-261 Classon avenue and the manufacture of the Maco will be continued. A large number of the carburetors have been used by motor car makers with satisfactory results and the Gleason-Peters company is contemplating a sales campaign of nation wide scope.

JOINS LOZIER STAFF.

Frank H. Smith Is Again Associated with Sales Manager Paul Smith.

Renewing an association of years' standing, Frank H. Smith, formerly of the Studebaker and Maxwell companies, has joined the sales staff of the Lozier Motor Company, Detroit, maker of Lozier cars, under Sales Manager Paul Smith. Frank Smith was formerly assistant to Paul Smith when the latter was sales manager of the Studebaker Corporation, and although the two men are not related, they were constantly being introduced as brothers.

Frank Smith is one of the most widely acquainted travelling salesmen in the automobile business and is thoroughly conversant with sales conditions all over the country. He also numbers many newspapermen among his friends owing to his connection with many automobile publicity events during the past five years. He will act as special travelling representative of the Lozier company, working from Detroit. His services will be largely in the nature of a connecting link between dealers and the home office.

WOOLER WITH CONTINENTAL MOTOR.

Well Known British Engineer and Designer Remains Behind in This Country.

Ernest Wooler, until recently designer for the Rolls-Royce Company, Ltd., and Brazil Straker & Co., Ltd., England, and a member of the Institute of Automobile Engineers of Great Britain, one of the recent party of visiting British engineers, did not return to his home country, having taken a position with the Continental Motor Manufacturing Company, Detroit, maker of Continental motors.

Mr. Wooler was enthusiastic over the automobile industry in this country and its magnitude appealed strongly to him. The future of the business in America and the wider field to be found here were factors which induced him to remain. Mr. Wooler is an engineer of wide experience and his acquisition by the American industry is a distinct gain. He has designed some of the most expensive cars made, including the famous Crossley racing machine, and he is a driver of considerable reputation.

STROUT'S ENVIABLE RECORD.

Something About the Man Who Will Direct Haynes Sales Policy.

The Haynes Automobile Company, Kokomo, Ind., maker of Haynes cars, enjoys the distinction of having two men connected with its organization that were born in Portland. One is Elwood Haynes, builder of what is regarded as America's first gasoline car, who first saw the light of day in Portland, Ind., while the other is Sales Manager George H. Strout, whose birthplace is Portland, Me. Mr. Strout was recently manager of sales and advertising for the Cole Motor Car Company, Indianapolis, maker of Cole machines, but resigned to take a similar position with the Haynes factory.

His selection is regarded as a happy one, inasmuch as his genius for securing business is recognized throughout the industry. While with the Cole company his record as district sales manager, handling most of the territory between the Mississippi river and the Atlantic Coast, was unusually brilliant. Mr. Strout is himself thoroughly satisfied with what he accomplished in the interests of that car, a sentiment which is wholly reciprocated by the entire Cole organization, and which found expression through President J. J. Cole when he congratulated the Haynes Automobile Company upon securing the service of such an able executive, at a dinner tendered Mr. Strout previous to his leaving the Indianapolis concern.

Mr. Strout was born in Portland, Me., Dec. 26, 1870, and he was fitted for college at Boston. He graduated from Swarthmore College in Pennsylvania, and after teaching for one year at the Harvard preparatory schools in West Newton, Mass., he entered upon a business career. The bicycle business first interested him at Boston and two years later he went to New York City to become branch sales manager of the Monarch Cycle Manufacturing Company, Chicago. Then 25 years old, he became known in the East as one of the youngest executives in the country. With the advent of the American Bicycle Company in 1899 the Monarch company was included in the general plan of consolidation and Mr. Strout resigned. He went to the Alaskan gold fields, where he remained for two years. Returning, after adding substantially to his finances, he became junior member of the brokerage firm of Chilberg & Strout, New York City.

George H. Strout, Sales Manager, Haynes Automobile Company.

In 1903 he entered the motor car industry, forming the Western Automobile Company, St. Paul, Minn., a remunerative enterprise, which he sold in 1905. He then went to Hartford, Conn., where he took charge of the sales of the Columbia electric and gasoline cars, his record while there attracting the attention of manufacturers in the Middle West. He was in Indiana, being connected with the Apperson Bros. Automobile Company, Kokomo, from 1907 until 1911, when he went to New York City for a brief time in the interests of a Detroit truck concern, returning to Indiana to become identified with the Cole firm. During his four years with the Apperson concern he materially increased the output of the factory, with the assistance of of A. G. Seiberling, who was recently promoted to be general man-

Digitized by Google

ager of the Haynes company, with which he became connected in October, 1912. Thus, with experience ripened, these two men are again together and their future activities cannot but react to the benefit and prosperity of the Haynes company.

LEAVES WESTINGHOUSE COMPANY.

H. G. Mills Becomes Manager of Detroit Branch of Electric Auto-Lite Company.

One of the most interesting announcements in the automobile world recently is that of the resignation of Horace C. Mills from his position as special representative for the automobile starting, lighting and ignition division of the Westinghouse Electric & Manufacturing Company, to become affiliated with the Electric Auto-Lite Company, Toledo, O. He will be manager of the Detroit branch, with headquarters in the Boyer building, and will be closely associated with C. O. Miniger, secretary and treasurer of the company. Together they will have charge of the sales and service throughout the country.

Mr. Mills has been identified with the automobile accessory trade for 15 years. He introduced the first vibrating spark coil for ignition purposes to automobile manufacturers, and in 1902 organized the Providence Spark Coil Company, Providence, R. I., becoming its first vice president. This company was instrumental in bringing about a universal adoption of this system by motor car makers until the vibrating coil was supplanted by the invention of the magneto.

REMOVES TO CONNECTICUT.

Cameron Manufacturing Company Purchases New Plant in West Haven.

It is announced that the entire plant of the Cameron Manufacturing Company, Beverly, Mass., maker of Cameron pleasure and commercial cars, will be removed to West Haven, Conn., where the factory formerly occupied by the Mathushek Piano Company has been purchased. The concern has been in Beverly for the past six years, but for some time it has been seeking a better location where financial and shipping conditions would result in improved manufacturing facilities.

The Cameron Company is incorporated under the laws of Connecticut with a capital of $1,000,000, of which $200,000 will be placed with New Haven men. The new factory provides about 75,000 square feet of floor space, and has been idle for about a year. It is planned to produce 1000 machines for 1914, and it is expected that the plant will employ about 250 men when in operation shortly after Aug. 1.

E. S. Cameron, the designer of the Cameron car, is well known in the motor car industry. He is said to be the first engineer to produce a steam car with a shaft drive. This was in 1898 and one of the machines built in that year is stated to be in service today and doing the work it was designed for 15 years ago. Frank S. Corlew is general sales manager of the company and conducted the negotiations for the concern's removal to West Haven.

PARTIN-PALMER COMBINATION.

Chicago Concern Enlarges Plans to Handle Product of Three Manufacturing Plants.

As a result of the constancy of C. C. Darnall's faith in central sales organization, the Partin Manufacturing Company, a large selling concern of Chicago, has combined with the Palmer Motor Car Company of Detroit, maker of Palmer cars, and the plans of the combination are of much interest to the automobile trade. The relation between the two companies will be the same as that of the manufacturing and sales departments of any well regulated business and unlimited capital is said to be behind the venture.

Mr. Darnall is one of the pioneers of the selling end of the motor car industry and as general sales manager of the Partin Manufacturing Company, which position he assumed in April, he will direct the sales of the output of three automobile factories, only one model being made in each. Mr. Darnall was general sales manager of the Crow Motor Car Company, Elkhart, Ind., for four years, leaving that concern to join the Partin company. For seven years previously he was general sales manager of a large selling organization in Chicago, with an extensive automobile department. During these connections he carried out successful selling campaigns.

Every detail of the business not directly connected with the production end will be removed from the various plants and the output of the three factories will be sold through the Chicago office. There is to be no conflict with respect to models, as each factory will produce a car that does not in any way come in competition with the product of the other plants.

At the head of the Palmer Motor Car Company is another pioneer in the industry, Randall

Digitized by Google

A. Palmer, who organized the Cartercar Company of Pontiac, Mich., in 1905, and continued to direct the concern as general manager until he resigned in February, 1912. His success is familiar to those in the industry and as an engineer of recognized ability he has made a special study of automobile designing.

George H. Partin, who is responsible for the finances of the Chicago firm, is well known in Tennessee and the South as a very successful business man. He has been financially interested in the automobile industry for several years and intends to devote his entire time to the new enterprise. Associated with him is H. F. Graper, capitalist and banker of Lexington and Nashville, Tenn. In fact, the Partin Manufacturing Company, with general offices at 542-547 National Life building, Chicago, is a copartnership owned and controlled exclusively by Mr. Partin and Mr. Graper. In the Detroit company are William H. Lankin, J. H. Pratt and others. Mr. Lankin is president of the Palmer Motor Car Company and previous to his connection with that company he was proprietor of one of the largest hardware concerns in Michigan.

The line to be sold by the Partin Manufacturing Company consists of the following: Partin-Palmer, six-passenger touring car, with 115-inch wheelbase, 38 horsepower Mason motor, centre control, with left hand drive; Partin, six-passenger touring car, with 45 horsepower Rutenber motor, 120-inch wheelbase, electric lighting and motor starting system, etc.; Crown, cyclecar, with four-cylinder, 21 horsepower motor.

Some of the Men Who Will Administer the Affairs of the Partin-Palmer Sales Combination, the Headquarters of Which Are in Chicago.

NEW AND NOVEL ACCESSORIES THAT APPEAL TO MOTORISTS

Underwriter Automatic Valve.

The Underwriter fire prevention automatic valve is manufactured by the Underwriter Valve Company, 620 Industrial Trust building, Providence, R. I. It is an ingenious device, comprising a small valve which is inserted in the fuel line, near the carburetor, etc., and in the event of a fire it automatically shuts off the supply of gasoline. In the case of a carburetor catching fire through a backfire, for example, the blaze would only continue until the fluid in the vaporizer became exhausted. The valve is made of bronze, copper and German silver and is held against closing by a fusible link, so designed as to melt at a temperature of 155 degrees Fahrenheit. It is held that the material is so sensitive that it can be fused by the flame of a match. The moment the link melts a spring closes the valve.

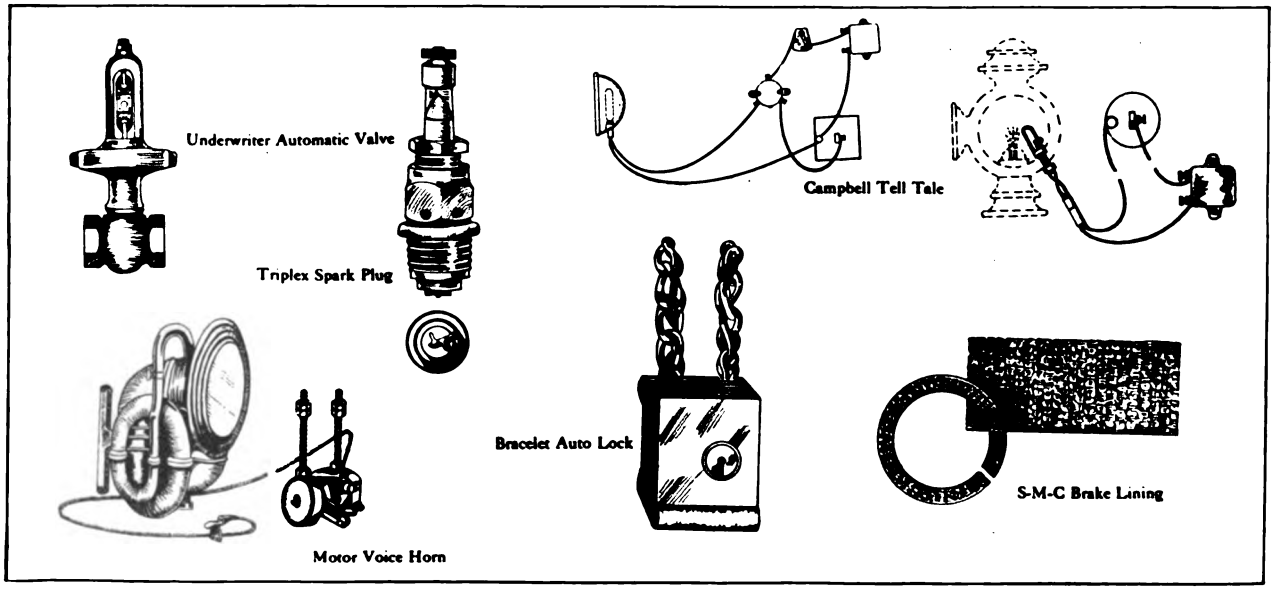
Triplex Spark Plug.

The Triplex spark plug, so termed because it provides three sparks instead of the one conventional flame, is made by the Chas. R. Bates Company, 35 Warren street, New York City. The central electrode is molded into the porcelain and diverted at the firing end .25 inch off centre; that is, with a one-inch porcelain face it would emerge .25 inch from the edge or shell. Separated from it by the usual .03125-inch gap is a T head pin. A second pin is provided and separated from the first named by a gap. The construction is such that the gaps form a straight line across the end of the porcelain to the contact pin. The current jumps from the first gap to the T head member, which is insulated, flows through it to the other side and jumps the second gap, and so on to the outside shell pin and to ground. It is held that the intensifying of the current makes for great efficiency and that complete combustion of any mixture is obtained.

Campbell Tell Tale.

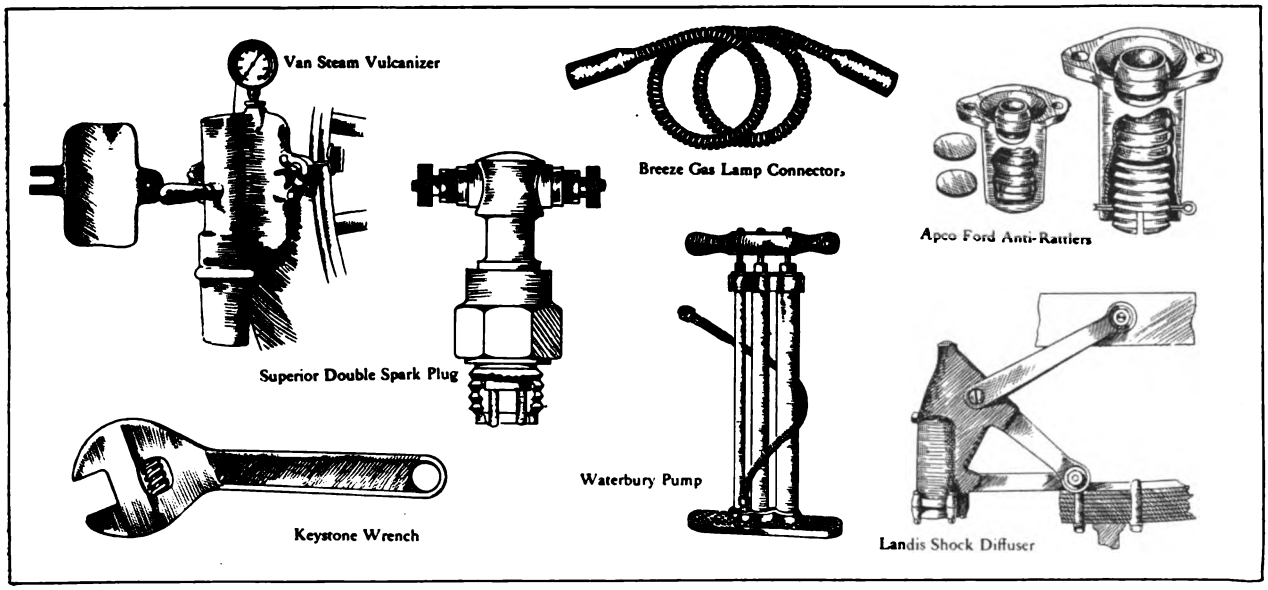
The Campbell Manufacturing Company, 3715 Wentworth avenue, Chicago, is marketing the Campbell tell tale, which is an inexpensive and practical device for notifying the operator of the car when the tail light is extinguished. It is made either for kerosene, gas or electric units, and its simplicity is shown by the accompanying illustrations. The tell tale proper is constructed of a composition of metals which expands when in proximity to heat. When fitted to a kerosene lamp it is inserted as shown, and should the light be extinguished the metal arms contract, closing an electrical circuit and causing operation of a small, compact buzzer. It will be seen that the tell tale is an automatic switch, and but a single dry cell is needed. A cut-out plug is provided, a switch member, and this is utilized when lighting the lamp. But a few seconds are required to expand the metal of the tell tale. The latter is also adjustable. The installation and wiring of the electrical unit is simple and provision is made for a combination outfit; that is, the tell tale may be employed for both kerosene and electricity. It is not necessary to install a buzzer as the usual electric horn may be utilized to give warning of an extinguished light. The equipment comes complete, is compactly constructed and of high grade material. It not only effects economy in that fines are avoided, but makes for a factor of safety by preventing rear end collisions due to the rear signal being extinguished.

Motor Voice Horn.



The Motor Car Equipment Company, 55 Warren street, New York City, is marketing the Motor Voice horn, which presents interesting features in that it is operated by a small air motor actuated by the flywheel of the engine, and that the signal cannot be operated by the small boy when the car is inoperative. Control of the air is by a push button type of clip on the steering wheel or other convenient place. Connection between the clip and air motor is by a Bowden cable enclosed in a braided metallic tube. The sound produced by the Motor Voice horn is said to be far reaching, but not at all disagreeable. It is durable, requires no attention after installation, and its upkeep is included in the first cost.

Bracket Auto Lock.



The Bracket Auto lock is the product of the Bracelet Auto Lock Company, 32 North Clark street, Chicago, and its design is such that it may be employed to lock the throttle and spark levers, or both, the steering wheel, or all three. It is a universal lock in that it will fit any make of motor car and comprises a Yale lock body attached to which are two chains. These cannot be broken after being secured to the part without so seriously damaging it as to prevent operation of the machine. All keys are different. The Bracelet Auto lock is constructed in different sizes to meet the requirements of different machines. The Bracelet Auto Lock Company has an attractive proposition for dealers.

S-M-C Brake Lining.

The Staybestos Manufacturing Company, Germantown, Philadelphia, is producing S-M-C brake lining, which is constructed from the highest quality asbestos and resistance wire, both fireproof and durable materials. It is compactly woven and scientifically treated in such manner as to provide the greatest efficiency and maximum service. It is held by the maker that S-M-C when in contact with metal will lock the wheels of the car instantly if desired. It is not affected by heat, water, oils or gasoline, and is guaranteed. It is produced in forms for friction or transmission clutches and these are made

Digitized by Google

in a large variety of styles and sizes. The brake lining comes in conventional widths and thicknesses. Special forms are constructed to order.

Van Steam Vulcanizer.

The perfecting of small, portable vulcanizers has resulted in a large number of motorists completing successfully repairs to inner tubes and cut casings. Vanderpool Bros., 723 West Mulberry street, Springfield, O., is marketing the Van portable steam vulcanizer adapted especially for the owner's use. It is designed for service on casings and tubes, and when the former are to be repaired it is not necessary to remove them from the rim. Steam is generated with an alcohol lamp attached to the lower part of the instrument, and the pressure is regulated by turning the lamp, thereby closing an air vent. This holds the steam at the required working pressure. Illuminating gas can be utilized if desired, a tube connection being provided. The Van can also be employed with any steam plant by utilizing a hose or pipe. The equipment is very complete.

Superior Double Spark Plug.

The advantage of utilizing two sparks in a cylinder is well known. The Superior Motor Specialty Company, 44 North Fourth street, Philadelphia, is marketing the Superior double spark plug, which permits of dual sparks in the cylinder without the installation of the dual, double type of magneto, etc. When two simultaneous sparks are desired one side of the Superior is connected by a single wire to the regular single plug, and the lead from the source of current supply attached to the other side of the Superior. The double plug may also be utilized for two independent sets of ignition and when provision is made for only one set of plugs, by being so wired that one side may be employed for the magneto and the other for the battery. There are a number of combinations possible with the Superior.

Breeze Gas Lamp Connector.

When rubber tubing is utilized to connect the acetylene headlights with the main line, it deteriorates through exposure to the air, unless protected by a suitable insulation. This results in inefficiency and loss of acetylene. The Breeze Carburetor Company, Newark, N. J., is marketing the Breeze lamp connectors, constructed of flexible metal hose which is held to be leak proof, as well as indestructible. This is obtained through a special packing. The connectors are made in any desired lengths, finished in polished brass, nickel, black enamel or woven, and with rubber or metal tips for making connections. They are moderately priced.

Apco Ford Anti-Rattlers.

The Auto Parts Company, Providence, R. I., maker of Ford specialties and accessories, is offering a new device known as the Apco Ford Anti-Rattler. They are made in two styles, one with a screw adjustment and the other with a disc. They are utilized to eliminate the rattle caused by wear of the front axle radius rod ball bearing, which is constructed without means for adjustment. The construction of both types is shown in the accompanying illustration and it will be noted that the use of hardened discs provides means for taking up wear from time to time. The screw design makes for great convenience as fine adjustments may be made, the operation involving the removal of a cotter pin and rotating the screw plug until a slot in it registers with the housing member. A coil spring provides for a cushioning effect, eliminating vibration as well as undue wear, and it presses a hardened cup shaped cone against the ball proper. Both types are moderately priced and guaranteed.

Keystone Wrench.

The Providence Auto Equipment Company, Providence, R. I., is marketing the Keystone wrench, which is of the adjustable type. It is a steel forging and is polished all over with the exception of the webbing. The jaws and other components are carefully hardened and it is held that the wrench will operate successfully on square or hexagon nuts and bolts. It is made in six, eight, 10 and 12-inch lengths, having openings varying from .75 to 1.3125 inches.

Waterbury Three-Cylinder Pump.

The Noera Manufacturing Company, Waterbury, Conn., is producing the Waterbury three-cylinder tire pump, which presents practical features in that it can be taken apart by simply removing the three retaining plugs on top of the cylinders. The latter are constructed of highly polished brass, with heavy base, and 22 inches of five-ply rubber tubing and a high grade connection are also included. Both sides of the handle are provided with nut protecting plates. Special attention is paid to the plunger washers and leather valves, and these are held to give maximum service with a minimum of attention. It is claimed by the maker that the Waterbury is one of the most powerful pumps on the market and that it will inflate a tire quickly with a minimum of effort because of the triple cylinders. Each pump is tested to 300 pounds pressure before shipment.

Landis Shock Diffuser.

The Landis Shock Diffuser, made by the Landis Engineering & Manufacturing Company, Waynesboro, Penn., differs from conventional types in that it is non-adjustable and embodies the desirable qualities obtained by air, liquid and springs in shock absorbers. It is mounted between the frame and the spring and compression and recoil of the latter are so compensated for that there is held to be no resistance to the action of the spring nor is its resiliency affected. In brief, the Landis comprises a liquid containing housing in which there is a piston and rod, the latter being provided with suitable linkage. The movement of a cylinder is limited

Digitized by Google

and the use of valves or openings regulates the flow of oil, the liquid flowing freely or otherwise according to the movement of the spring. An air chamber is also incorporated within the piston rod, it providing resiliency at the beginning of the hydraulic resistance and preventing a shock incident to sudden violent pressure on the oil.

Six Little Yankees.

Six Little Yankees is the product of the Six Little Yankees Company, Philadelphia, and is a carbon remover put up in the form of pellets. It is held that by their use not only is carbon removed, but is prevented from accumulating in the cylinders, and that the process does not interfere with the service of the car or require any work other than the removal of the spark plugs and placing six of the pellet like members in the cylinders and over the piston. This is done when the motor is hot. It is claimed that but five minutes is required for the pellets to dissolve. Each cylinder is treated separately and by using a small amount of kerosene in the usual manner it is held that carbon and soot are displaced.

Peerless Black Japan.

Peerless extra fine black japan is manufactured by the Columbus Varnish Company, Columbus, O., and is produced especially for enamelling lamps, radiators, fenders, etc. It is tough, elastic and durable, and one coat will cover brass, nickel or iron. It is held that it will not crack or peel and is not affected by changes in temperature. No priming coat is required, all that is necessary being to have the surface of the object clean. It is stated that it will dry hard in 10 hours and that a high gloss finish is obtained. It comes in pints, quarts, half-gallon and gallon cans. The Waite Auto Supply Company, Providence, R. I., is Rhode Island distributor.

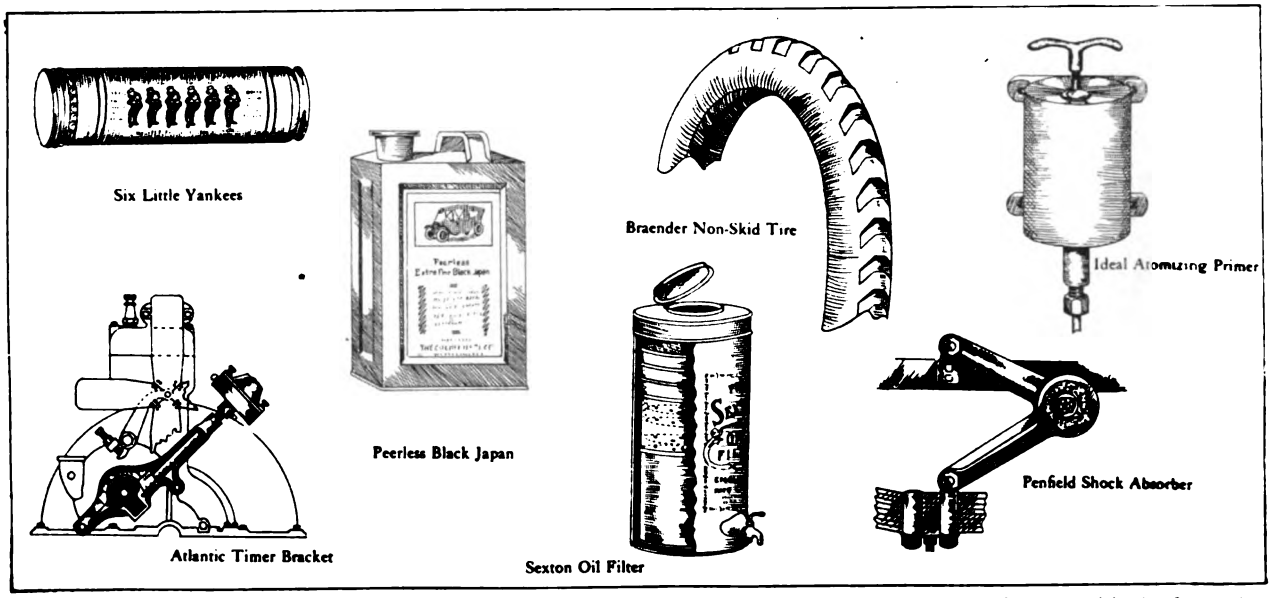
Braender Non-Skid Tire.

The Braender non-skid tire is the product of the Braender Rubber & Tire Company, Rutherford, N. J., and is made by the single cure, wrapped tread process, from the highest grade Para rubber and the best combed Sea Island fabric. The single cure differs from others in that the mold protrudes only one-third of the distance from the beads, the maker maintaining that this permits the cloth wrapper to compress the tire proper without buckling. The Braender is manufactured in plain and non-skid treads and the company points out that the durability and efficiency of its product is exemplified by the performance of the shoes on Ralph Mulford's Mercedes car in the recent Indianapolis race. It will be remembered that the 500 miles was completed without a change of casings.

Ideal Atomizing Primer.

The Ideal atomizing primer is manufactured by the Interstate Auto Accessory Company, 2124 East Washington street, Indianapolis. It comprises a small container mounted on the dash and leading from the device to the intake manifold is a copper tube. The primer is filled with gasoline, and by actuating the plunger handle a sufficient amount of properly mixed fuel and air is forced to the intake pipe, making it a simple matter to start the engine. The primer is easily installed and is designed to be utilized with the Ideal speeder which was described in these columns recently.

Atlantic Vertical Timer Bracket.



The Atlantic vertical timer bracket is manufactured by the Atlantic Machine Company, 963 Atlantic avenue, Brooklyn, N. Y. It is designed especially for model T Ford automobiles and its installation makes for convenience in that the commutator is easily accessible through its vertical position. The design comprises a complete bracket, spiral gears, timer shaft and commutator. As will be noted by the accompanying illustration, the attaching of the Atlantic is a simple matter, involving the removal of the regular timer, slipping on a gear and locking the bracket by means of two cap screws. The device is so constructed that it may be fitted by the most inexperienced as the work does not involve any knowledge of timing, etc. It is pointed out that it may be installed in a few minutes and that there are no alterations to be made, each part being accurately machined to insure an easy fit.

Sexton Oil Filter.

It is considered good practise to change the lubricant in the crankcase of a motor and when this is done the old oil is usually thrown away. If the lubricant is allowed to remain in service too long the carbon, etc., acts as an abrasive, causing undue wear of the motor components. The Sexton Can Company, 2 Hartford street, Boston, is manufacturing the Sexton oil filter, which is a sturdily constructed vessel 10 inches in diameter and 20 high, although different sizes are made to meet individual requirements. The can is provided with a hinged top and a series of filtering members, also a faucet for removing the filtered oil.

Penfield Shock Absorber.

The Penfield shock absorber is the product of the Penfield Shock Absorber Manufacturing Company, Meriden, Conn. It comprises a triple circular coil compensating spring, the ends meeting on an adjustable stop which has a wider face than the spring driving plunger, allowing a free centre. The centre bolt member is utilized only to hold the case and cap together. Provision is made for lubrication. The case and cover are of semi-steel. The triple spring is 14 inches long and on a five-inch movement of the car will compress one inch. It is held that the tension of the spring will not alter in service and that the free centre movement provides smooth riding qualities. It is also pointed out that no adjustment is required after installation. The Penfield is made to fit the weight of car specified, the tension of the springs being adjusted accordingly, the proper tension being held by an adjustable stop.

TOURING THE MOOSEHEAD LAKE REGION.

Itinerary Also Includes Stop at Old Orchard, Portions of the Rangeley District and Some New Roads in the Heart of the White Mountains.

UNTIL a few years ago the ways leading into the wooded sections of Maine were little more than trails in many instances. The influence of the automobile has been just sufficient to change these trails into passable roads, without detracting from the pristine wildness of the sections through which they wind their way. This is particularly true of the Moosehead and Rangeley Lake regions, into which the accompanying itinerary leads the tourist.

Leaving Boston, the first day, the route takes the so-called short line to Newburyport and Portsmouth, and while the roads are not quite as ideal as those which skirt the North Shore, they are largely of macadam and good time can be made. The remainder of the distance into Old Orchard is over ground which is somewhat new to the present day tourist. Previous to 1907, when a disastrous fire visited this well known watering place, it was conceded to be one of the prettiest beaches in the country. Within the past two years the automobile has helped it to regain its old time popularity.

Old Orchard comes into view long before it is reached, because of the long shore line which must be skirted. The beach itself extends from Saco river to Pine Point at the mouth of the Scarboro river, a distance of about 10 miles, with a breadth of 300 feet at low tide. The sand is very hard and smooth and affords an admirable driveway, as has been evidenced by the successful automobile races conducted thereon in 1911 and 1912. Because of the absence of the undertow, surf bathing is held to be perfectly safe. Near the hotels is a beautiful forest park of 30 acres, with pleasant paths, arbors and rustic adornments, while at Foxwell's brook is a picturesque waterfall 60 feet high. The beach derives its name from an old apple orchard, the last tree in which died before the Revolution.

The second day finds the tourist in Portland for the beginning of the trip across the state into the Moosehead lake region. Brunswick was first settled as Pejepscot in 1628 and was three times destroyed by the Anasagunticooks before the present name was given it in 1737. It is the seat of Bowdoin College, and if time permits the Bowdoin gallery of paintings should be visited by all means. The falls of the Androscoggin at the head of tide water also are worthy of interest.

The immense ice houses on the banks of the Kennebec at Gardiner will attract attention, and it may be mentioned that the view from the Common, which contains five acres and is situated on Church hill, 125 feet above the river, is superb. Hallowell is noted for its quarries of white and light gray granite. Augusta is the capital of the state and contains much of interest. The night stop is Waterville, the seat of Colby College, founded in 1813. The city is built along rambling streets on a broad plain above the river, near the Taconic falls, and has some very handsome residences.

The remainder of the distance to Moosehead lake is over ways reconstructed for the most part for the use of motorists, and a splendid new garage has been erected at Greenville Junction, where the steamer meets the tourist for the journey to Mt. Kineo. Moosehead lake is famed in prose and poetry for its immense size and its scenic loveliness. It is the largest and best fishing ground in America. Deer and moose abound in great numbers in the vicinity. The lake itself is 40 miles long and from two to 18 miles wide. It contains many bays and beautiful islands, which add to the charm and fascination of the scenery.

View of Moosehead Lake from the Base of Mt. Kineo.

The surrounding hills are lofty and are covered with deep forests, while here and there a mountain towers above the green of the level woods, the whole forming a rare panorama of which the eye never tires. Grandest of all these is the famous Mt. Kineo, whose precipitous face looms up nearly 1000 feet above the surface of the lake, and whose western slope runs off into a level green-clad peninsula.

The route from Moosehead to Rangeley is through the Maine woods a greater portion of the way. The Rangeley lakes are five in

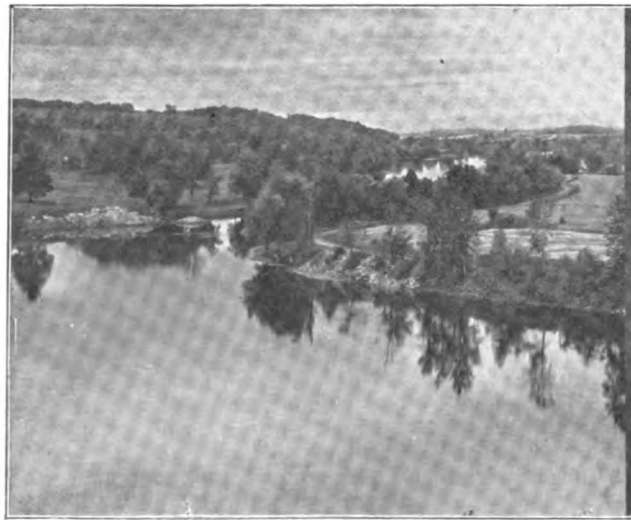
Digitized by Google

Tuckerman Ravine in White Mountains.

Tip-Top House on Mount Washington.

number, and have a total area of about 90 miles. All are interconnected by narrows and streams, making a continuous waterway of 56 miles. The Rangeleys are the source of the Androscoggin, which has its rise in Lake Umbagog, and emerges from the forest to find its way to the sea after turning scores of mill wheels. The farthest east is Lake Oquossoc, conceded to be the gem of the entire chain and most often referred to as Rangeley. Its elevation is 2000 feet above sea level. Across the outlet is Bald Head, a mountain easy to climb, and an ideal spot from which to watch the sunrise. Mooselucmaguntic is the largest of the five. Separated but slightly from this and really a portion of the big lake is Cupsuptic. Then come Molechunkamunk and Wolokennebacook. The waters of all these are as clear as crystal and so large are the fish taken from them, it is an unwritten law that trout of less than three pounds shall be returned to their native element.

The fifth day takes the tourist into the White mountains, with night stop at Jefferson, N. H. The view of these peaks over the route selected is one of sublime grandeur, and it is maintained that the finest panorama of the Presidential range is to be found at Jefferson. It is held by some that this exceeds the view at Bethlehem, inasmuch as it is seen from one of the highest ridges of the entire district.



The return to Portsmouth is down the east side of the mountains over better known ways. While it is possible to utilize the outward route from this point into Boston, it is anticipated that the tourist will care to visit other scenes, and the route selected combines much of beauty and interest. The roads throughout this section are quite as good as well.

ITINERARY NO. 9.

LYONS-KNIGHT TO UTILIZE WORM DRIVE.

THE Lyons-Atlas Company, Indianapolis, Ind., purchaser of the plant of the Atlas Engine Works of that city, maker of the Atlas-Knight gasoline and Diesel oil engines, announces particulars of a complete series of Lyons-Knight pleasure cars, a feature of which is a worm drive, and deliveries of which have already commenced. It is stated that the plant has facilities for the production of 50,000 cars annually, and that the company is backed by ample capital to increase this output if desired. Commercial vehicles will also be produced.

The pleasure chassis will be known as the model K, to which are fitted four body types, a five and a seven-passenger touring, a sedan and a berline. The equipment is very complete, including electric lighting and motor starting, and attention has been paid to those details which make for ease of operation and comfort of the passengers.

Lyons-Knight Model K, a Seven-Passenger Touring Car, Having a Worm Driven Rear Axle—The Complete Series Includes a Five-Passenger Touring, Sedan and Berline.

The Lyons-Knight motor embodies all of the latest improvements of the Knight engine, including the best features of European practise, and differs from previous designs in that the sleeve travel has been increased, thicker walls utilized and larger fillets and stronger lugs employed. The oiling system also has been improved, no splash being utilized, the lubricant being positively pumped to all bearings, etc. The piston and sleeve surfaces are lubricated by means of an adjustable pressure regulator in the oil circuit directly connected with the throttle lever, insuring a supply proportionate to motor speeds and eliminating smoking.

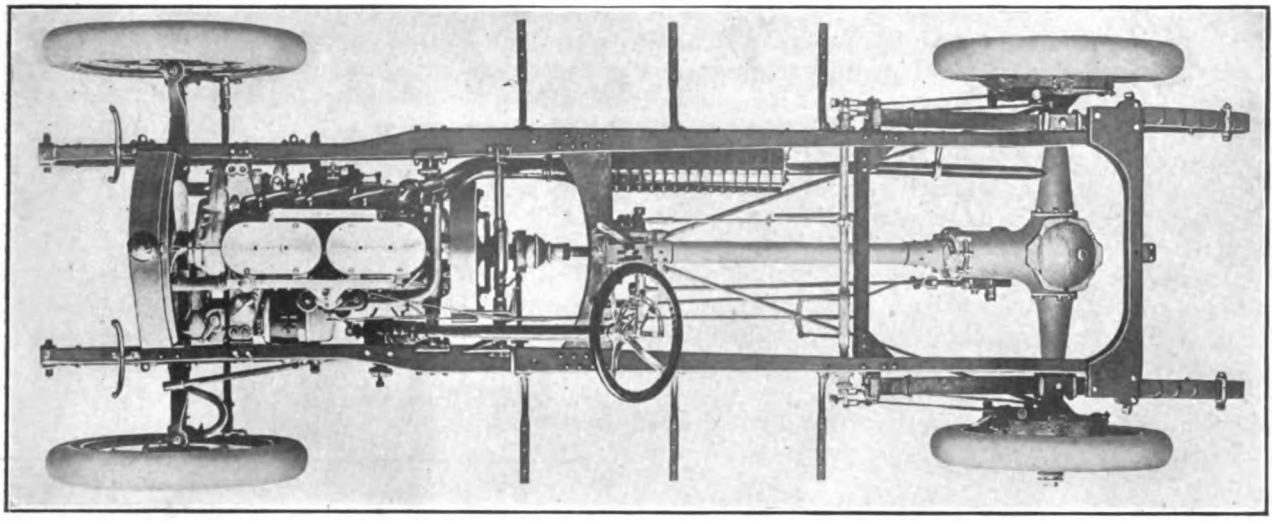
The bore of the four-cylinder motor is 4.5 inches and stroke 5.5, and although rated at 32.4 horsepower by the S. A. E. formula, it develops 50 in a brake test at 1200 revolutions. It is held that its maximum is 70 horsepower. It is also pointed out that its efficiency increases with service as the sleeves become highly polished, reducing friction and improving compression. The crankshaft, eccentric shaft and connecting rods are of chrome nickel steel, heat treated, and the crankshaft rotates in five large bearings with adjustable bronze bushings, babbit lined. Provision is made for adjustment by shims of varying thickness. The crankpin bearings are similarly adjustable.

The cylinders, pistons, sleeves and heads are all cast in the foundry of the company and are of a special mixture of cast iron. The crankcase, chain case and cylinder caps are of aluminum, and all other external surfaces are either black enamel or heavily nickel plated. The heads of the cylinders, which are cast in pairs, are covered with a polished aluminum cap, enclosing the spark plugs, wires, etc., and hard rubber buttons are incorporated for testing the plugs without removing them. The design of the inlet ports and their location is such that a very short manifold is possible, reducing opportunity of condensation of the mixture to a minimum. The exhaust manifold is also well designed, being three inches in diameter at the exhaust pipe connection. Carburetion is by a double-jet vaporizer, especially designed for the Knight motor and automatic regulation of the auxiliary air insures maximum efficiency and economy of fuel. The carburetor

Digitized by Google

is hot water jacketed and hot air is supplied by a flexible tube. Control of the mixture is by a lever on the steering column.

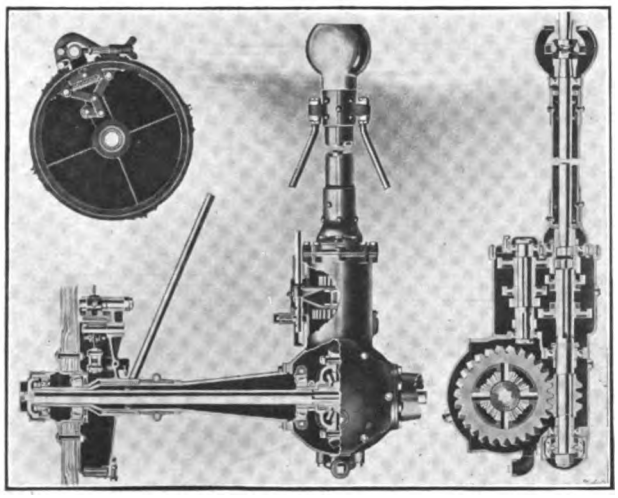
Cooling is by a centrifugal pump and cellular radiator of ample capacity, insuring proper cooling under the most severe conditions of service. The fan is a one-piece aluminum casting driven from the crankshaft by a silent chain, and an adjustable idler maintains the proper chain tension, as well as of those actuating the magneto and eccentric shafts. The chains are enclosed in an aluminum case and lubricated by a constant stream of oil from the main oil pump. The oil reservoir is formed by a sub-base underneath the crankcase and an intermediate air space is provided, maintaining the lubricant in a cooled condition. A force feed plunger pump operated by one of the sleeve eccentric rods, takes the oil from the reservoir and forces it through the motor. The lubricant is filtered before it returns to the sump.



Ignition is by a dual, high-tension, water proof magneto, and it is stated that the car can be operated with it on the direct drive at a speed of five miles an hour. The lighting and motor starting system is the Northeast, a combined unit, located on the left hand side of the power plant.

The clutch is of the three-plate type, enclosed in the flywheel, and the centre steel floating member is very large in diameter, also thin and very light to provide maximum friction surface with minimum weight. It is engaged by being gradually compressed between two outside plates through the action of three powerful toggle joints. The centre plate is faced with Raybestos. The transmission is of the selective type embodied in the rear axle, eliminating strain on the universal joints, two of which are utilized. The usual three speeds forward and a reverse are provided, the direct drive being geared at 3.85:1.

The rear axle is of the full floating type with a special bronze housing. The extensions on which the wheels are mounted are tapered seamless drawn steel tubings. The driving shafts, differential and transmission gears are of a special alloy steel, heat treated and hardened, and the transmission and worm shafts are mounted on annular ball bearings. Timken roller bearings are utilized in the differential and rear wheels. A three-inch torsion tube encloses the drive shaft and is rigidly connected to the rear axle housing and terminates forward in a large hollow steel ball and socket joint, secured to the centre cross member.



The worm gear drive has been adopted by the company because of its success abroad. It is held to be absolutely silent under all conditions of service and to make for maximum efficiency in that the load is distributed over several large teeth. The ground clearance under the worm is nine inches, but as the case or housing is round and inclines upward it is stated that obstacles 12 inches high may be surmounted without damage to the construction, which is sturdy.

The chassis and wheelbases of the model K are all similar, with the exception of the rear springs, which are made heavier on the six and seven-passenger types. These bodies are eight inches longer and consequently somewhat heavier than the four and five-passenger designs. The wheelbase is 130 inches regardless of body type, with tread standard, 56 inches.

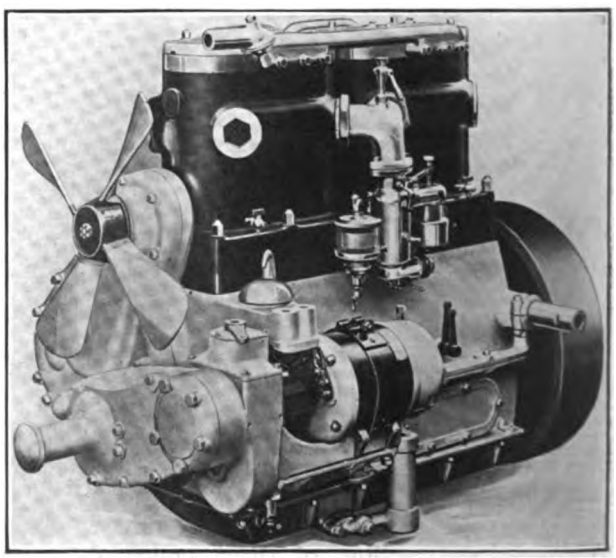
Top View of the Lyons-Knight Model K Chassis, Indicating Accessibility and Sturdy Components.

Digitized by Google

Showing the Worm Drive and Transmission as a Unit, Also the Construction of the Liberal Sized Brakes.

The front axle is the latest Timken, having a drop forged I beam centre section. The hubs and steering heads are equipped with Timken adjustable roller bearings. The front springs are semi-elliptic, 38 inches long and 2.2 wide, and being designed very flat are claimed to hold the front axle parallel with the rear. The rear springs are three-quarter elliptic, 54 inches long by 2.5 wide, and are made as are the front members from a special alloy steel. They are swivelled on the axle and shackled at both ends, and do not take any of the drive. Compression grease cups lubricate all shackle bearings, etc., and the shackles are constructed in one piece, have extra wide bearings and are fitted with lugs to prevent reversing. All spring bolts are hardened and ground, and the end of the springs are bronze bushed. The frame is of pressed steel, with a channel section five inches deep and four wide in the centre. A six-inch drop at the rear makes for a low centre of gravity, as well as ample road clearance.

Two sets of large brakes are fitted, both acting on the rear wheels. The service members are of the external contracting type, 2.5-inch face, lined with Raybestos, and the leverage obtained is very powerful. The emergency brakes are of the internal expanding type, being split steel rings 2.5 inches wide, faced with Raybestos. They provide maximum efficiency with the car operating in either direction. Both sets are easily adjusted without tools and equalizers are fitted.



The steering gear is of the irreversible type and the column is set at a comfortable angle and surmounted by an 18-inch corrugated hard rubber wheel. Additional stability is secured by the use of a supplementary bracket midway of the column and attached to the dash. The shafts in the steering gear housing are of steel, hardened and ground, and all bearings are bronze bushed. All steering linkage bearings have hardened and ground bushings and studs.

The driver is located at the left with centre control. The gear shift lever is very short and convenient to the driver, and works in an H slot with a minimum movement. The spark and throttle levers are mounted on the top of the steering wheel. The usual accelerator is included. Mounted on the dash are the shut-off fuel and reserve gasoline valves, the lighting switch and motor starter control. The speedometer, clock, gasoline and oil pressure gauges, are mounted flush and these members are lighted by a dash lamp.

The fuel tank has a capacity of 22 gallons and two are held in reserve. It is mounted in the upper part of the dash over the toeboard, providing a short, direct gravity feed and insuring the use of the entire contents of the container even when surmounting steep grades.

Demountable, quick detachable rims are standard equipment, and the tires are extra large, being 37 by five inches both front and rear. Wood wheels are furnished as regular equipment, although wire may be obtained if desired. The equipment includes a hydraulic shock absorber, which is attached to the worm gear casing from the centre of the rear frame member, reducing side sway to a minimum as well as absorbing road shocks.

The body designs of the Lyons-Knight are noticeable for their neat and attractive lines. They

Motor of the Lyons-Knight Presents an Unusually Neat Appearance, Being Compact and Having Spark Plugs, Etc., Encased by Removable Caps.

Digitized by Google

are of sheet aluminum, a light and rugged construction and a material taking a very fine finish. All body types are very roomy and have high sides, while the upholstery is high grade in every particular, deep, soft Turkish cushions being employed. The rear seats of the five and seven-passenger bodies are 52 inches wide and the best hand buffed leather and black horse hair are employed for upholstering. The berline and sedan bodies are exclusive in design and appearance, and are finished and painted to order. Entrance to the front seat is possible on either side of the five and seven-passenger types.

The standard colors are dark blue and brewster green with black upholstering. The top is a Golde, which can be raised or lowered by one person, and the material is genuine black pantasote. The windshield is made in the factory of the company, one of its own designs, and has two adjustable plate sections, a wide one above and a narrow member below. The lower part of the top plate swings out, providing a rain vision, while the other section forms an adjustable ventilator.

The equipment includes in addition to the top, dust cover, windshield, a Warner speedometer and clock, combination tire holders, trunk rack in the rear, two extra demountable rims, coat and foot rails, cocoa matting for the tonneau, complete tire and tool kits, electric trouble lamp, electric horn and a large storage battery. All metal trimmings are either black enamel or nickel plate. The storage battery and tools are carried under the front seat and the running boards present a clean appearance.

ADVANCE CONTEST NOTES.

New Long Distance Road Race—Plans for Meets in Various Places.

Using the borderland route passing through Canutillo, Tex.; Lanark, Deming and Lordsburg, N. M.; Rodeo, Douglas, Bisbee, Huachura, Vail, Tucson, Florence and Mesa, Ariz., arrangements have been made for a 531-mile road race from El Paso, Tex., to Phoenix, Ariz., during the Arizona state fair in November. The race is scheduled for Nov. 4-5, at the same time as the San Diego-Phoenix and Los Angeles-Phoenix road races. This is the first time an event of this character has been attempted between El Paso and Phoenix, although the other contests named have been held in previous years.

It is announced that Ralph Mulford will drive a Peugeot car in several of the events scheduled for the beach meet at Galveston, Tex., July 28-30, and it is expected that a second machine of this make will be driven by Arthur Ferguson. The chief event of the meet is to be a 4.5-hour continuation race, to be run in three sections on three different days, the prizes aggregating $5000.

Three road races, two of which probably will be run simultaneously, have been listed for the 1913 Santa Monica meet, over the course in Santa Monica, Cal., Aug. 9. The first is for cars of 230 inches or less, the distance being 101 miles; the second for cars of 231-450 inches, 202 miles, and the third for a free-for-all for 303 miles.

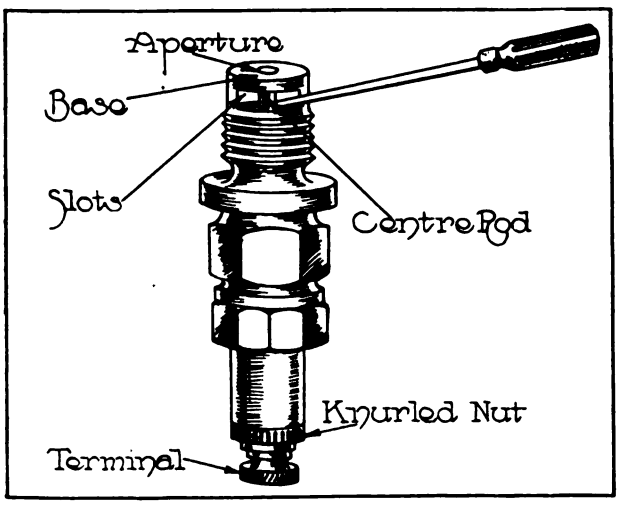
It has practically been decided by the Savannah Automobile Club, Savannah, Ga., to limit the number of entries in this year's Vanderbilt Cup and Grand Prize events to 12 cars each. The Grand Prize will be a free-for-all, while the machines in the Vanderbilt Cup event will be limited to 450 inches.

The Chicago Motor Club expects at least 35 entries for the fourth annual Elgin road races, Aug. 29-30. There are to be two events. That of the first day will be for cars of 300 inches and under, the distance being 305 miles, for the Chicago Automobile trophy, formerly the Cobe cup. The second day will witness the 305-mile race for the Elgin National trophy, the cars being limited to 450 inches.

CONVENTION OF "OLD TIMERS."

Reminiscent Banquet Tendered Assistant Superintendent of Rambler Organization.

Forty-eight employees of the Thomas B. Jeffery Company, Kenosha, Wis., maker of Cross Country Rambler cars, whose terms of service with the company aggregate 887 years, made up a party of old time bicycle men and pioneers in the sale of automobiles which was banqueted by the company recently. The affair was given in honor of Assistant Superintendent M. Mattson, who severed his direct connection with the Jeffery organization July 1 after serving 23 years, to become a farmer and Jeffery dealer in south central Texas.



The record of the employees follows: 29 years, two; 28 years, one; 27 years, one; 24 years, two; 23 years, four; 22 years, five; 20 years, three; 19 years, two; 18 years, eight; 17 years, four; 16 years, one; 15 years, four; 14 years, two; 13 years, two; 12 years, seven. A feature of the evening was the recital of the many unpublished acts of kindness and charity performed by the late Thomas B. Jeffery.

MECHANICAL NOTES FOR OWNERS.

Importance of Maintaining Proper Spark Gap—Using Motor Starter to Locate a Knock—Inexpensive Gas Condenser.

MANY times the failure of the motor to develop its maximum efficiency may be traced to the ignition. By this is not meant that the magneto or other source of current supply is at fault, for magneto troubles may be said to be rare in these days of high quality production, but it is surprising the lack of attention given the spark plugs by the owner. Although the car manufacturer usually provides a type or design best adapted to the motor and while the problem of proper plugs and location is now receiving the attention it deserves, in the event of a plug being broken, a new one is usually selected by the owner without any thought as to its especial adaptability to the cylinders of his automobile.

Illustrating Method of Adjusting Gap of Mosler Closed End Type of Spark Plug by Inserting Blade of Screw Driver in Slots.

In replacing a damaged plug with a new one, care should be taken to purchase one having the same length of base. A shorter or longer base may result in locating the sparking points in a pocket where dead gas accumulates, or exposing the points to undue heat. These finer points of ignition are usually overlooked by the motorist, resulting in a lack of motor efficiency that would otherwise be obtained by the use of proper spark plugs.

The adjustment or maintenance of the gap is an important factor and the care and attention given the plug will depend upon its design and that of the motor. If ordinary spark plugs are employed with a magneto the intensity of the current will ultimately burn the electrodes, widening the gap and resulting in inefficiency. Too large a gap is likely to cause missing at low speeds.

No hard or fast rule may be laid down as to the gap to be maintained as the makers of magnetos differ. Some recommend .015625 inch, while others advise between this measurement and .03125 inch. As the majority of magneto manufacturers supply a wrench for setting the break of the contact points, the tool could be employed for setting the plug gap, provided it is approximately the same.

With the open end type of spark plug it is a simple matter to correct any increase or decrease of the gap. The enlargement of the space may be due to other than burning, as in displacing a plug from the valve cap the points may come in contact with the cylinder or wrench, bending them and increasing the gap. Sometimes it is necessary to disassemble the plug to remove carbon deposits and in the reassembly care should be taken to set the gaps of all plugs exactly alike.

The setting of the electrodes of the Mosler closed end type of plug, made by A. R. Mosler & Co., Mt. Vernon, N. Y., is as easily accomplished as with the open end designs, but many motorists do not understand the operation. The position of the centre rod or electrode with reference to the aperture in the base is regulated vertically by removing the terminal and loosening the knurled nut securing the electrode in position. By rotating the electrode to the right, its point is brought into closer contact with the inner edge of the opening in the base. Turning the centre rod to the left increases the distance. Altering the position of the electrode, however, is seldom necessary, it being set accurately at the factory.

The point of the centre rod should be adjusted so that it is exactly in the centre of the aperture. If the rod has become bent through accident or the plug has been taken apart, it is a simple matter to readjust it. The method is shown in an accompanying illustration and is similar to that utilized in the Mosler factory. Insert the blade of a small screw driver in one of the large openings of the base as shown in the sketch and by exert-

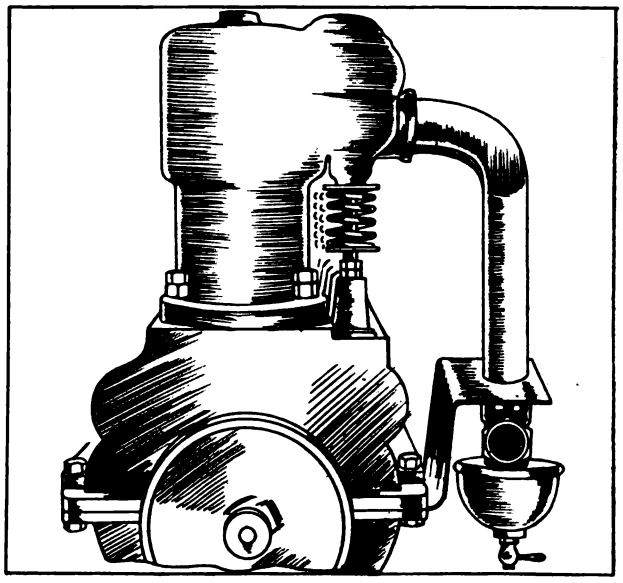
Digitized by Google

ing a gentle pressure the position of the centre rod may be altered as desired. The screw driver blade serves as a lever and the shell of the plug as the fulcrum.

PROTECTING THE CARBURETOR.

Owing to the fact that the aperture of the spraying nozzle of a carburetor is very small, the passage of the gasoline is easily restricted by the presence of foreign elements. The modern carburetor is more or less protected when installed on new cars, by the utilization of a tube or pipe conveying heat from the exhaust pipe or manifold. On old types of motors and where the piping arrangement is not employed, more or less dirt is drawn into the carburetor. With the valve tappet guides badly worn more or less lubricant works out, covering the carburetor and eventually interfering with its proper operation.

A device for protecting the vaporizer from the oil is shown in an accompanying illustration. It comprises a sheet of heavy tin sufficiently large to permit of bending into the shape presented in the sketch, and wide enough to protect the carburetor from the flying lubricant. The device is secured at its lower end to the bolts retaining the lower crankcase to the upper, and is held firmly to the intake pipe above the carburetor by cutting a slot. By making small projections as shown in the drawing, these may be clamped to the pipe by wire. Of course the design would have to be altered to meet the requirements of different motors, but the size of the tin needed could be ascertained easily by making a pattern from cardboard.



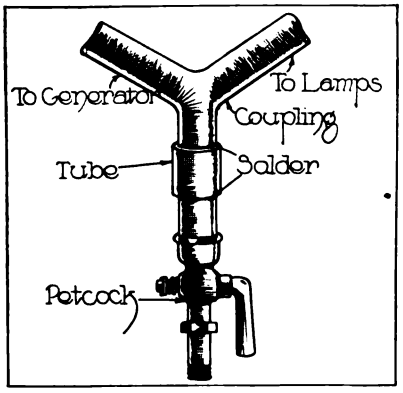
HOME MADE GAS CONDENSER.

Although electric lighting has succeeded acetylene to a great extent, there are many machines equipped with the latter system and including a generator. Certain designs give trouble owing to more or less moisture collecting in the tubing leading from the generator to the lamps, resulting in clogging the burners and impairing the efficiency of the lights. There are a number of filters or condensers marketed which collect or trap the water and while they are inexpensive, the following contribution from a reader will prove of interest to those owners who prefer to construct accessories for their cars.

Am contributing a suggestion for making a filter for a generator which may be of service for those who are experiencing trouble with their lighting system. The generator that came with my Ford car gave me considerable trouble in that water would collect in the tube at the lowest point of the line, and unless the pipe was cleaned at frequent intervals, the lights would act very unsatisfactorily. The water appeared to stop up the burners and the trouble always occurred when the lights were most needed and when it was not always convenient to clean out the burners and the pipes.

I am enclosing a sketch of the filter I constructed, and it cost but a few cents and was easily made. Having a T coupling and an old gas petcock on hand, I bought a piece of brass tubing sufficiently large to insert one end of the coupling and the petcock as shown in the drawing. It was not a drive fit, but by using plenty of solder I was able to make a good tight fit. I placed the filter at the lowest point of the line between the generator and the lamps by cutting the rubber pipe and slipping the ends over the free ends of the coupling. The petcock and coupling hang vertically because of their weight, and all moisture collects in the lower section of the coupling. It is a simple matter to remove any water that may accumulate by opening the petcock.

The suggestion of the reader could be improved by utilizing a couple of clamps for securing the filter to the underside of the running board or other convenient place. These could be made from strips of brass or heavy tin, and by drilling holes for screws. In constructing a condenser similar to the one described, the section of the coupling to which the petcock is attached should be an inch or more in length to provide a suitable retaining capacity.



Method of Fitting Pan or Shield to Protect the Carburetor from Lubricant Thrown Out by Old Motors.

TANK FILLING SUGGESTION.

The converting of touring cars into roadsters usually means the fitting of a new fuel tank, and although it is possible to purchase a container ready made, some motorists have one constructed to conform to the design of the machine and to obtain a certain capacity. A rebuilt car having a special tank and filler device was noted recently by the writer. In mounting the tank it was car-

Digitized by Google

ried very close to the back of the seats, and as the filler member was small, considerable trouble had been experienced by the owner when replenishing the supply of fuel. This was due to the fact that the average funnel utilized at supply stations and garages was too large to provide a suitable vent and when pouring gasoline a large quantity of the fluid was wasted by the displaced air. The method of remedying the trouble is shown in an accompanying drawing, it consisting of fitting a large sized petcock in the container. In renewing the supply of fuel this petcock is opened, providing a suitable vent for the escape of the air.

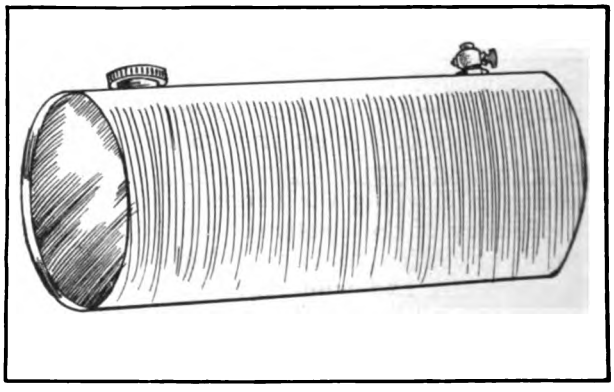
An Inexpensive Gas Condenser.

VALUE OF HYDROMETER.

The replacing of the gas lighting system with electricity does not necessarily mean that the motorist is relieved from responsibility or care of the newer method of illumination. There are many owners of new cars who believe that the only work connected with the electrical system is that of turning a button. This is an error as the storage battery requires attention; that is, if maximum service is to be expected. This applies to the dynamo as well as straight battery system.

Although the purchaser of a new car is given an instruction book dealing with the care of the lighting system, it generally is misplaced or the suggestions unheeded, and is not thought of until some trouble develops. Storage batteries will give efficient service if cared for properly. A motorist makes it a point to see that he has plenty of fuel and oil, but is apt to neglect other details equally as important.

Every user of a car equipped with an electric lighting system should employ a hydrometer for testing the electrolyte of the cells and this should be done at least once a week. The instruments are not expensive and provide accurate means for noting the condition of the fluid, which is an important factor. All readings should be taken before adding distilled water in case the level of the electrolyte is below normal.



Hydrometers denote the specific gravity and are valuable in that they check the performance of the dynamo or generator, indicating whether or not it is performing its work of charging the batteries properly. When a battery is fully charged the specific gravity should read between 1.280 and 1.300 as indicated on the hydrometer, and it should be approximately the same in all cells.

NOVEL USE OF MOTOR STARTER.

An owner of a machine equipped with an electric motor starter was annoyed by a slight knock. Being familiar with the gasoline motor through having owned several cars, he removed the side inspection plates and tested the bearings, etc., for lost motion, but all were tight and in proper order. The knock was located in a novel manner. As it was not feasible to operate the engine under its own power with the lower crankcase removed, the owner evolved the plan of utilizing the motor starter. Removing the crankcase and lying under the motor, he had a friend operate the starter, and the knock was speedily located. It was caused by the big end of the hinged connecting rod touching the side of the crankcase. The rod was reversed and the mysterious knock disappeared.

CARE OF THE COMMUTATOR.

Although the magneto has succeeded the battery, commutator and coil ignition system to a great extent, there are many cars fitted with the latter. Some machines are equipped with a low-tension magneto-generator having a timer and

Showing How Vent for Escape of Air from Fuel Tank May Be Utilized to Advantage.

coil, such as the model T Ford for example. As the commutator is an important factor in the ignition system, breaking as it does the primary

Digitized by Google

current, it should be cleaned and lubricated from time to time.

If it is very accessible it is a simple matter to remove the cover and wash out all dirt and old lubricant with gasoline, after which the working parts should be oiled, although some favor vaseline. If the timer cover cannot be displaced without considerable trouble, it may be washed by utilizing an oil can filled with gasoline and squirting the fuel through the lubrication opening.

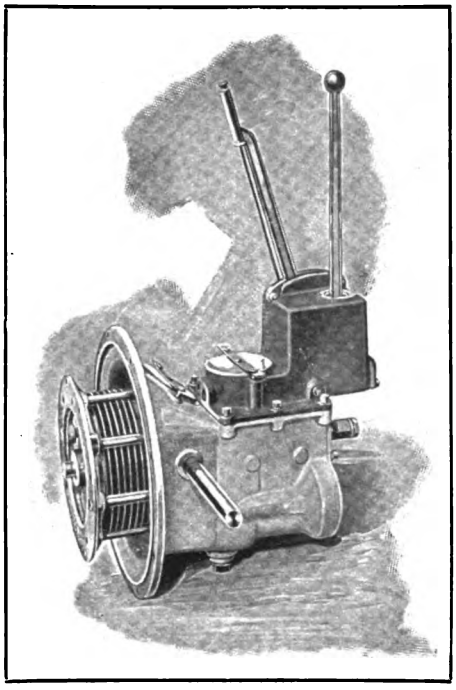
If the car has seen considerable service it will be well to examine the timer bearings, fibre and contact blocks to note if they are worn. If the blocks are uneven the roller will have a tendency to jump, creating a poor contact, as well as affecting the operation of the motor. It is a simple matter to remove the fibre ring, take it to a machine shop and have it trued up.

THE STUTZ AT TACOMA.

Wins All Three Principal Events and Comes in Second in the Inter-City as Well.

While announcement was made in the Seventh Annual Touring Number that Earl Cooper in a Stutz had taken two of the principal events in the meet at Tacoma, Wash., July 5-7, additional information shows that Stutz cars took all three and finished in second place in the Inter-City race as well. In the contest for the Potlach trophy, the first day, Cooper lowered Tetzlaff's record for the course, made in 1912. The place cars in the three big events follow:

Car	Driver	Time
Potlach Trophy, 220 Miles.		
Stutz	Cooper	2:49:32.0
Keeton	Burman	3:10:28.0
Nyberg	H. Endicott	*
Inter-City, 102 Miles.		
Stutz	Parsons	1:33:53.8
Stutz	Cameron	1:36:36.8
Hudson	Hanson	1:51:16.0
Montamarathon, 250 Miles.		
Stutz	Cooper	3:32:08.2
Flat	Lewis	3:35:00.0
Tulsa	Hughes	*



*Flagged before race was finished.

NEW FULLER TRANSMISSION.

Fuller & Sons Manufacturing Company, Announces New Unit Power Plant.

The Fuller & Sons Manufacturing Company, Kalamazoo, Mich., announces a new unit power plant which will be known as the 1914 model T U, and which is designed for service for motors of from 25 to 40 horsepower. It has the same shafts and gears as are utilized in the sub-frame and cross member types made by this concern, with modifications necessary for a unit construction. Any type of standard ball bearings is fitted. Raybestos discs operate against hardened and ground saw blade steel members in the clutch construction. A ball throw-out is employed and it is held that the clutch brake works to a nicety. Two large handholes with detachable covers are provided for inspection and for renewing the supply of lubricant.

The ball and socket centre control is mounted in either a forward or rear position, the levers extending up through the floor of the car in a small square, box shaped protection of the cover, making for easy installation, as well as preventing the entrance of elements or hot air into the driver's compartment. Right or left hand drive is offered with centre or outside control. Six different pedal positions are possible, three on each side, providing a wide range of location. The gears have .875-inch face and are constructed of an alloy steel, carefully heat treated and ground. The splines are milled integral from the solid bar. The reverse idler gear is extra large, rotating on a solid steel roller bearing well retained. An aluminum alloy is utilized for the case, which is held to be sound proof. The transmission clutch and control are stated to be extremely light and the best of workmanship and material is incorporated. Those parts subject to the greatest stresses are made with a large factor of safety. The transmission is designed for standard four or six-cylinder motors. The gear changing lever is of the rocking ball type, having a short movement.

New Fuller Unit Type of Transmission.

UNIFORM MOTORING LAWS.

Upon the first thought it would appear that the movement in favor of uniform motoring laws inaugurated by New Jersey was doomed to failure because of the lack of interest displayed by the various commonwealths to which appeals were made. However, when it is remembered that previous attempts to interest state officials in the subject have resulted in absolute refusal to consider the proposition, it is readily seen that much progress has been made in this instance.

The New Jersey proposition had for its object the appointment of commissioners, under authority from the legislatures of the various states, who were to confer in an effort to draft a bill which could be enacted in the several commonwealths. All of the New England and Middle Atlantic States were invited to take part in this conference. Maine, New York and Delaware responded, but the others took no action.

Perhaps it requires the viewpoint of an optimist to foresee any permanent results from this situation. Certainly, the outlook is somewhat discouraging, in view of the attempt that has been made to interest the public in the desirability of uniform laws of this character. The only possible suggestion that can be made is that the public—and particularly the motorist—has not succeeded in making clear its desires to its representatives in the legislatures to which the proposition was presented. The success of the movement depends in no small measure upon the activity of motorists, and they should lose no opportunity for arousing public opinion in favor of uniform motoring laws.

THE AMERICAN INVASION.

While at first European motor car manufacturers were not inclined to consider the so-called American invasion in a serious light, the matter has been undergoing a decided change within the past year or more. The recent conference in Geneva, Switzerland, at which it is stated manufacturers were present representing Great Britain, France, Germany, Austria and Belgium, indicates in no uncertain terms the importance in which the subject is now held.

It will be noted that from the first the objection has been directed against the machines which are sold abroad at figures placing them in the so-called low price class. The result of the conference, at which it may be assumed the makers represented were in the possession of information dealing with the construction methods employed in this country, was such that it was definitely determined that there was no way of meeting this competition. And it was decided that the only argument that could be advanced was the superior excellence of the European product.

From an American viewpoint the decision of the Geneva conference is decidedly interesting. It virtually is an admission that the manufacturing facilities abroad are unable to cope with the situation. Unless there is to be disposition to resort to unfair competition or some more drastic method, the American market abroad appears to be firmly established.

INTRODUCING THE CYCLECAR IN AMERICA.

Growth of This Branch of the Industry Abroad Since the Appearance of the Original Bedelia Model---An Attempt to Define the Distinctive Features of the Type.

WHAT is a cyclecar? The term has come into being in America only within the past few months. Already some half dozen concerns have been organized for the production of cyclecars, and several others are to be announced shortly, if rumor is to be believed. Obviously, the industry in America must become accustomed to the new word, and the motoring public is desirous of considering the subject intelligently.

Engineers will disagree upon the precise definition to be applied to the new vehicle. With some, at least, the word implies a four-wheel car built on the simplest motorcycle lines. But the word may be held to have originated in England, where it was at first applied to the motorcycle fitted with three wheels and carrying a passenger between the two forward wheels, usually termed a tricar in this country. However, this application appears to have fallen into disuse since the appearance of the newer four-wheel cyclecars.

The initial cyclecar, in its present designation, undoubtedly was the Bedelia, built by M. Barbeau of Paris, France, in 1910. This was in effect a small automobile driven by a motorcycle motor. Its weight was less than 400 pounds, its length about 100 inches, its width 36 inches and its height 36. It was made to accommodate two persons, the passenger being seated in front, while the driver was located over the rear axle. The twin-cylinder motorcycle engine was just behind the front axle and a chain connected the motor sprocket with a sprocket on a counershaft crosswise of the car underneath the passenger seat. Belts ran from pulleys at the ends of the countershaft to pulleys on the rear wheels. Clutch action was obtained by drawing the rear axle forward by means of a hand lever at the right of the driver, this lever adjusting the tension of the belt and at the same time drawing the rear belt pulleys against the brake shoes. Steering was by means of a wire spoked hand wheel which turned the whole front axle through a drum on its shaft and a steel cable connection through pulleys.

This car was entered in a 138-mile road race and was regarded by all as a freak construction. It surprised its inventor by averaging 38 miles an hour, and later made 55 miles an hour on the track. The result was a perfect avalanche of "Bedelia" cars, particularly in England. The term cyclecar was not made to apply until some time later.

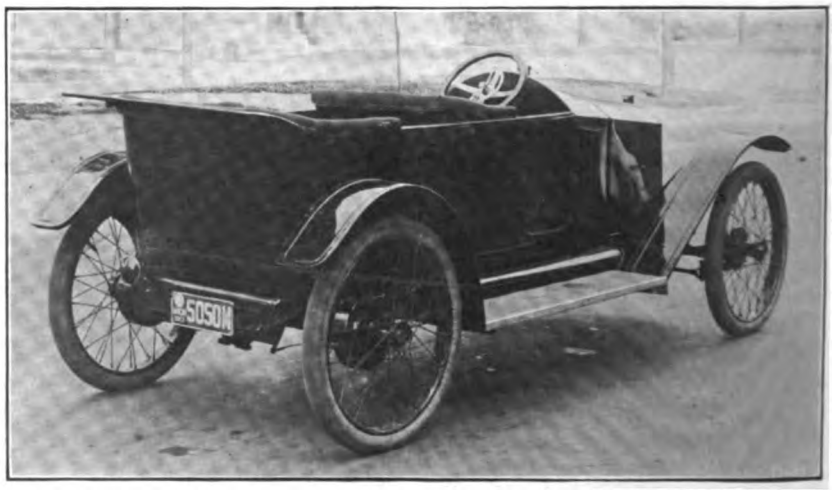
There are today something over 100 concerns in Great Britain engaged in the production of cyclecars and almost as many in Continental Europe. However, there are cyclecars and cyclecars, by which is meant that there appears to be no well defined type by which it is possible to determine exactly how the term should be made to apply. For example, the French cyclecar is built for speed and without much regard for appearance in many instances, while the British product more often resembles the small motor car of America. With some the motorcycle motor has been retained and with others the engine is spe-

Perspective of Economycar, Indicating Arrangement of Components and Seating Accommodations.

Digitized by Google

Front View of Carnation Tandem Design, Indicating Streamline Effect.

cially designed and might be considered suitable for regulation automobile use.



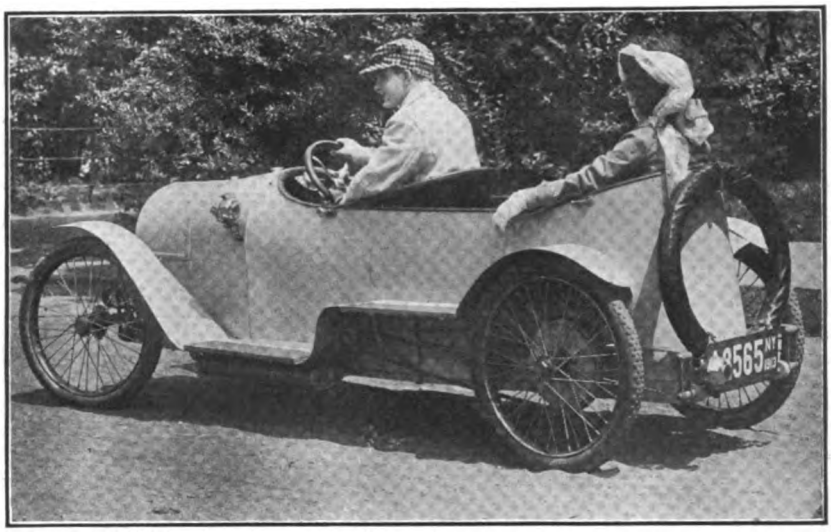
Thus it will be seen that it is somewhat difficult to evolve a definition which adequately describes the cyclecar. It is equally difficult to assign its place in the industry. Either it is an evolution from the motorcycle or it is the result of an attempt to place the advantages of the automobile within reach of the man of limited means. Excepting the more pretentious English vehicles of this class, the main objects sought by the designer appear to be simplicity, low first cost and minimum upkeep expense.

From the above information it will be understood that the cyclecar has enjoyed its greatest popularity in Great Britain. This is particularly true if the British definition of the term is to be accepted. There are two reasons. In the first place the British manufacturers have not been engaged in the production of low priced automobiles, and as a result many Englishmen were deterred from possessing a car. This also is held to have had a direct influence upon the wide use of motorcycles, tricars and sidecars in the British Isles. The other reason is to be found in the character of English roads, which permit of using a machine of any tread.

And while the first "Bedelia" cars in England were patterned very largely after M. Barbeau's example, the British demand for artistic body designs soon produced its effect. The situation has undergone constant change, until some of the cyclecars produced at present sell for as high as $1000, although they still retain the narrow tread, a feature of no inconsiderable moment, when it is remembered that the machine may be taken through a common door and housed in a shed or cellar, thus avoiding the necessity for special garage facilities. It will be understood that many of the old "Bedelia" cars are still being produced under the new name, but the point which it is desired to make is that the more pretentious cyclecars in England really take the place of the low and medium priced automobiles in this country.

In France and other portions of Continental Europe the average price for cyclecars does not exceed $350 or $375. The design follows more closely the Bedelia model, although attempt has been made to eliminate everything possible and create a speedy machine. The tandem seats are still retained in a large majority of cases, while in England the tendency is strongly in favor of two seats side by side.

Just as the sidecar had obtained a wide vogue in Great Britain and abroad before any consistent attempt was made to introduce it in America, history has repeated itself with the cyclecar. Before the arrival of the sidecar it was freely predicted, even by some motorcycle manufacturers, that it would not be found practical for American roads. It was maintained that while the passengers thus carried might traverse macadam ways with comparative ease, quite another story would be told whenever it should become necessary to take to the highways and byways off the beaten path. The sidecar is hardly more than a year old in America, but its increasing popularity would seem to indicate that the difficulties of



Three-Quarter View of Carnation, Showing Side Doors and General Arrangement of Tandem Seats.

Digitized by Google

negotiating American roads were by no means so insurmountable as had been supposed.

There are American motorcycle and automobile manufacturers who have declared that in their opinion the cyclecar has no place in the industry in America. The contentions have been based upon some of the same arguments that were used against the sidecar. It is held that the type of cyclecar built abroad is not suited for satisfactory use on American roads, and that an attempt to construct cyclecars which would stand up under the conditions presented must invite competition from the low priced automobile.

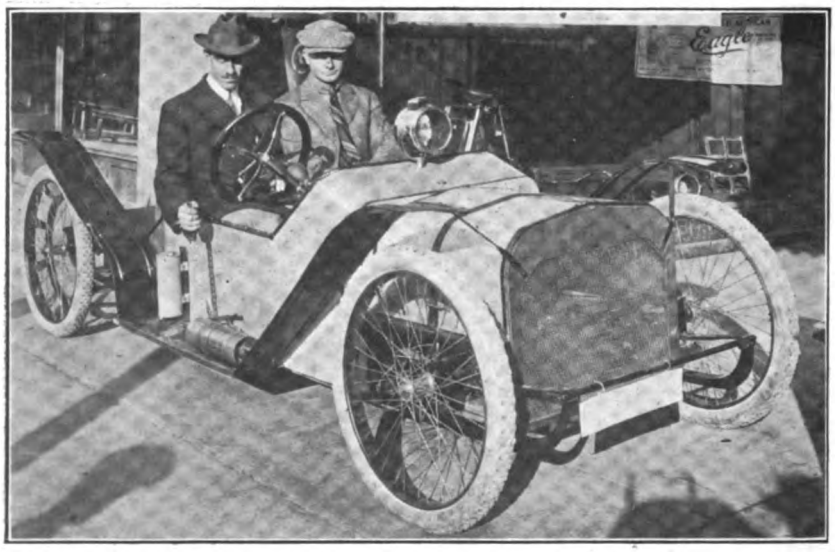
While something must depend upon the spring suspension and other components, the main objection to the cyclecar appears thus far to have been based upon the narrow tread. This undoubtedly arises from an attempt to compare road conditions here and in England. It may be admitted that English roads are ideal in this respect, and the same thing holds true of the main highways of Continental Europe. But in France, where the first cyclecars were produced, there are plenty of lesser turnpikes with ruts worn by traffic which, while perhaps not as bad as some of those in America, offer plenty of opportunity to test the practicability of this type of vehicle. The 36-inch tread was adopted by M. Barbeau, and continued by other French designers, with this fact in mind. The decision was reached only after a careful study of the situation, in which it was found that the usual width of road ruts in France was such that there remained a space of 42 inches between the wheel tracks—sufficient to permit of the use of a 36-inch tread and a three-inch tire.

The Smaller of the Two Twombly Models Presents Simple and Attractive Lines.

It is not to be presumed that American designers and manufacturers have entered this field without studying all the conditions. The problems presented are those for the engineer. The American public can be relied upon to give the new type of vehicle a fair trial. The advantages claimed for it are such as to make the innovation worthy of consideration.

Attention already has been drawn to the possibility of housing the machine without special garage facilities. Among the other features advocated are: Simplicity, involving the use of a minimum number of parts, although this depends upon the type of cyclecar produced; low centre of gravity, making for stability; streamline construction, reducing wind resistance to a minimum, and low maintenance expense. Of course, the first cost is an important factor, but it is expected that the entire construction will result in greatly increased fuel and tire mileage, thereby affecting the two most important items in the maintenance account. Sidecar statistics are available, from which it is possible to arrive at the conclusion that two persons can travel in this manner over ordinary country roads with a fuel cost of two cents a mile. With four tires, instead of two or three, it may be expected that the tire expense will be proportionately larger, but it is contended that the distribution of weight and other factors tend to reduce this item as well.

What effect the advent of the cyclecar will have upon the motorcycle and pleasure car branches of the industry is entirely problematical. It is possible that it may present results similar to those which have been cited in England. Accompanying illustrations indicate what is being offered among the original cyclecar productions in this country.



The Carnation is the product of the American Voiterette Company of Detroit. The concern is capitalized for $500,000 and is composed of men identified with the Keeton Motor Company, maker of the Keeton automobile. The car weighs 710 pounds, has a 44-inch tread and 100-inch wheelbase, and is equipped with a four-cylinder engine, with 3.25-inch bore and 3.75-inch stroke, giving a rating under the S. A. E. formula of 22.5 horsepower. The transmission affords three forward speeds and reverse. Drive is from the centre, with right hand shift.

Digitized by Google

Wire wheels, with 30 by three-inch tires are fitted.

There are to be three models, that shown being the first produced by the company. This has seats of the French type, arranged tandem with sloping backs, and upholstered in Bedford cord. Unlike the French design, however, the driver is placed in front. The body is deep and roomy and the hood slants toward the front. The radiator is an adaptation of the V type, and a round windshield is provided directly in front of the driver. The usual equipment of a light car, including electric lighting, is furnished. The entire construction is low and the machine is said to have a speed of about 50 miles an hour.

The other two models will be a touring car for four people and a roadster for two, seated side by side. The details concerning these have not been made public as yet, although it is assumed that the chassis will be practically the same.

The California Design Follows English Plan of Placing Occupants Side by Side.

The Economycar is made by the Economycar Company, Indianapolis, Ind. The machine weighs 393 pounds, fully equipped, and has a tread of 36 inches and wheelbase of 106. The engine is a two-cylinder, 8-10 horsepower unit of the motorcycle type. The drive is by silent chain and V belts, such as are used on motorcycles. The motor, which is air-cooled and located under a Vauxhall type hood, will start from the seat. Ignition is by Bosch high-tension magneto, and a Schebler carburetor is used. The gasoline tank is in the cowl dash, and feed is by gravity. It is said that the gasoline consumption is 40 miles to the gallon and that a speed of about 40 miles an hour can be obtained.

Two body types will be built, one for passengers and the other for use as a delivery wagon. The passenger car is termed a roadster for two, with seats arranged tandem, and ample seating capacity and plenty of leg room in front. There is a very sharp V shaped hood blending with the streamline of the body, which is 23.5 inches wide. The steering post is placed in the centre of the car and the front axle is pivoted, making for a short turning radius and for easy handling in congested traffic. Wire wheels with 28 by three-inch tires are fitted and the equipment includes one large headlight mounted in front on the steering pivot.

The California is made by the California Cycle Car Company, 818 South Main street, Los Angeles, Cal. The weight is 450 pounds, tread 44 inches and wheelbase 102. The motor is a 10 horsepower, air-cooled, two-cylinder unit, with bore of 3.375 inches and stroke of 3.875. It is maintained that this engine was designed and constructed expressly for cyclecar service. It has mechanically operated, overhead valves; 12-inch cooling fan, insuring a constant draft of air across the cylinders; a specially designed automatic oiler driven from the engine shaft, and large outside flywheel. Starting is by crank at the forward end.

The transmission to the countershaft is by friction drive. From the countershaft two heavy V belts transmit the power to the rear wheels. The belt tension is adjusted at will by the use of a convenient side lever, which throws the rear axle forward or back and also applies the emergency brake at the rear wheels. Steering is by hand wheel, which carries the spark and throttle levers, while the clutch and service brake are operated by the feet.

The frame is of angle iron, reinforced by hard wood sills. The underslung construction is employed, giving a road clearance of nine inches. The wheels are of wire, fitted with 29 by 2.75-inch tires, although three-inch tires will be fitted for the difference in the cost. The equipment includes side lights, tail light, horn, etc.

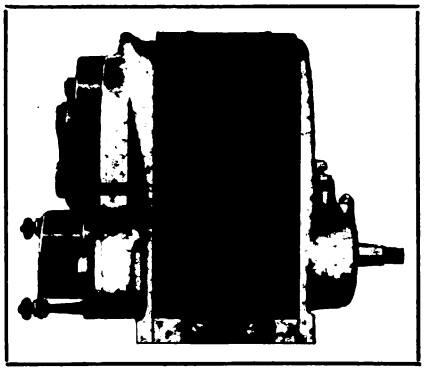
The Twombly is to be produced in two models by the Twombly Motors Company, 258 West 69th street, New York City, of which W. Irving

Digitized by Google

Twombly, well known as a designer, is vice president. Both of these will follow French practise in that the bodies will be designed to accommodate two persons, seated tandem, but with the driver in front. The upholstery is in red leather and the standard color is French gray with nickel trimmings.

The Twombly model B, an illustration of which appears herewith, has a wheelbase of 96 inches and tread of 38. The motor is a two-cylinder, air-cooled Twombly, V type, rated at 10 horsepower. The cylinder ports are opened and closed by means of piston valves, a construction which is held to make for silent operation. Ignition is by Bosch magneto. Power is delivered to a differential countershaft by friction transmission, and thence to the rear wheels by side chain. Wire wheels are used, 28 inches in diameter, shod with three-inch tires, and the road clearance is nine inches. The gasoline consumption is claimed to be from 40 to 50 miles to the gallon and the speed about 40 miles an hour.

The Twombly model A is similar in appearance, although it has a wheelbase of 102 inches. The tread and road clearance are the same as with the smaller machine, 38 and nine inches, respectively. The motor is a four-cylinder, water-cooled unit rated at 15 horsepower, with cylinders cast en bloc and utilizing the same type of piston valves as the other. The transmission is selective, affording three forward speeds and reverse, and drive to the rear axle, in which is incorporated the usual differential, is by shaft.

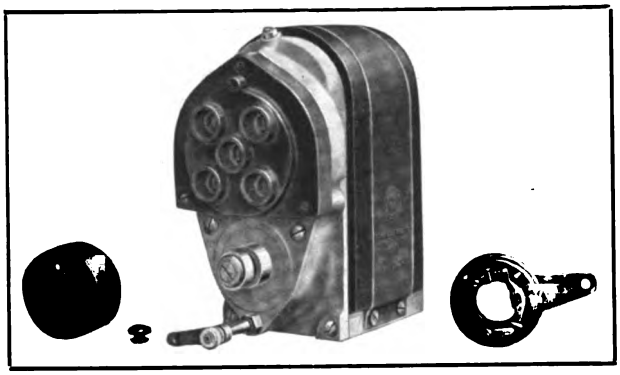


It will be seen, by these brief descriptions, that there already is a wide difference of opinion among American designers as to the proper definition of a cyclecar. While some are fitted with doors, others follow more closely the Bedelia model by being constructed with sides so low as to permit of stepping into the seats from the curb. There even is lack of uniformity regarding the seating accommodations, one machine having been announced to provide for four persons. The prices range from $350 to $500.

FEATURES OF NEW MODEL P REMY MAGNETO.

ANNOUNCEMENT is made by the Remy Electric Company, Anderson, Ind., well known maker of ignition and lighting instruments, of a new high-tension magneto which is to be known as the model P. The new instrument is of the wire wound armature type, producing a dynamic spark of great intensity with a distinct flame characteristic. The design is in no way radical or freakish, embodying as it does standard proven practise, and was carefully developed by the Remy engineers. Refinements of design and improvements for greater efficiency have been incorporated wherever possible, these being based on the 15 years' experience in the manufacture of ignition apparatus.

The new magneto is held to be absolutely water and dust proof. The end bearing plates are carefully and accurately machined to fit the magnets and the distributor is also similarly machined to fit the gearcase. A special packing is utilized in all joints to exclude water, oil, dust, etc. The distributor terminals are of water proof design and at the same time provide a reliable method of securing the high-tension cables. The circuit breaker is thoroughly protected by a cover of Bakelite, a heat resisting material of high dielectric strength, which is held to be decidedly superior to hard rubber or composition material, it being pointed out by the company that it is stronger, tougher and will not warp or crack, being non-hygroscopic.



The armature heads are of special bronze and the drive shaft is of a high grade steel cast into the armature head, providing a very rugged construction. The coupling end of the shaft is tapered, keywayed and threaded to S. A. E. standards. The armature winding is of cotton covered, enamelled wire, heavily impregnated with Bakelite, rendering it impervious to heat and moisture. The armature shaft revolves on special magneto type ball bearings protected from foreign elements by felt washers.

New Model P Remy Magneto.

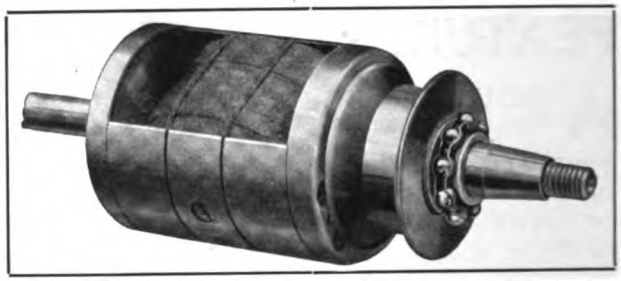
The circuit breaker of the new magneto has been improved over previous designs and is held to be exceedingly fast as well as positive in its action. It may readily be removed by the hands for inspection and its simplicity is apparent by the accompanying illustration showing the mechanism disassembled. It is claimed by the company that adjustments are unnecessary under normal operating conditions. The circuit breaker

Digitized by Google

Circuit Breaker and Housing Dismantled to Show Simplicity of Construction.

is constructed of a high grade chrome nickel steel, hardened in pyrometer equipped furnaces, ground to size and tested accurately for synchronism and degree of hardness. The timing lever may be attached to either side of the magneto as the circuit breaker and its housing are reversible. The timing range is ample, 35 degrees, and by carefully proportioning the magneto and coil it is held that practically the same intensity of spark is obtained at full retard as at the maximum advance.

The terminals of the spark plug cables are located in the face of the Bakelite distributor and are water proof as previously pointed out. Provision is made for easy timing of the instrument, an ingenious device known as a timing button being incorporated in the distributor. This permits bringing the circuit breaker into its proper position, as well as locating the proper terminal of the magneto. It also eliminates opportunity of connecting the wrong leads, a feature which will appeal to those who care for their own cars.



Illustrating Compactness of Coil Which Is Integral with Switch—The Latter Is Provided with a Locking Device.

The distributor gears are accurately cut, 24 pitch teeth being utilized. The large gear actuating the distributor proper is of bronze, while the smaller member on the armature shaft is of cloth and steel, a design insuring quiet operation. The distributor brush holder is of Bakelite and is rigidly mounted upon the brass distributor.

The magnets are constructed from a high grade tungsten steel especially heat treated and hardened. The condenser and case form the top plate or cover over the armature, and the condenser is well protected by being imbedded in a heat solidifying compound. In addition to being made moisture proof in this manner a Bakelite cover is utilized.

The coil employed with the new magneto differs from those previously fitted by the company, and the new design is not only held to be more decidedly efficient, but its neatness and compactness will be noted by an accompanying illustration. The switch is built integral with the coil and provides means for securing it to

Heat and Moisture Proof Armature Revolving on Special Type of Ball Bearings.

the dash, the switch face only appearing on the driver's side. The switch has the usual three conventional positions, these including "Magneto," "Off" and "Battery". A locking device is also incorporated, preventing use of the car by others than those intended. The coil is wound of cotton covered, enamelled wire, insulated by the Bakelite process. In order to securely anchor the coil winding within the fibre case it is imbedded in a compound of extremely high melting point, which is not affected by extreme cold.

As Bakelite is freely utilized in the construction of its magnetos, etc., the Remy Electric Company has installed special machinery for the production and use of this material. The company claims it has the largest plant of its kind in the world and produces from raw material practically everything incorporated in the construction of its various automobile electric equipment. The plant includes well equipped machine and assembing rooms, Bakelite and impregnating departments, brass foundry, forge shops, etc.

CORRESPONDENCE WITH THE READER.

Missing at Intermediate Speeds.

(1615)—I am driving a Cadillac car having a Schebler carburetor and Delco ignition. The motor starts easily and runs well at low speeds, but when the throttle is opened, say to about 15 or 20 miles an hour, the engine skips before taking hold and running evenly. The ignition appears to be all right. What causes the trouble?

CADILLAC.

Central Falls, R. I., June 28.

Assuming that the ignition is in proper order it would appear that the trouble is due to an incorrect setting of the carburetor on the intermediate or second speed, as it is termed. The mixture is presumably rich and this may be ascertained by noting the color and odor of the exhaust. Complete instructions for setting the carburetor will be found elsewhere in this issue.

Detachable Cylinder Heads.

(1616)—What are the advantages, if any, of the detachable type of cylinder heads? How are the Knox cylinders constructed? When a chain drive is utilized for driving the camshaft, how are the valves timed when it becomes necessary to remove the chain; that is, assuming that the chain is taken off and the camshaft has been turned? What methods are employed for taking up wear of the silent chain drive? J. H. M.

Lamar, Mo., July 13.

Detachable cylinder heads are a distinct advantage in that they make for convenience in cleaning out carbon deposits, as well as facilitate the work of grinding in the valves. At Fig. 1 is shown the single-cylinder Knox design with the cylinder completely assembled and disassembled. It will be noted that the head is easily removable, being retained by four studs, and that it requires but a few minutes to displace the retaining nuts and take off the head. This enables easy cleaning of the carbon on the top of the piston, also the removal of any deposits in the head proper.

As the head is removable it is a simple matter to grind the valves in on the bench or in any other convenient place. This saves considerable exertion, as well as bending over the power plant. It is also maintained that the valve in the head type greatly increases the power and efficiency of the motor.

Regarding the timing of valves when the camshaft is driven by a silent chain, the removal of the latter and the changing of the position of the shaft in relation to that of the crankshaft would involve the same method as with that of the gear drive; that is, the camshaft would have to be set in relation to the crankshaft so that the cams would start to lift the valves in accordance with the timing diagram of the motor.

With the flywheel marked as generally is the case, it would be a simple matter to ascertain the opening point of the intake or exhaust valve of the first cylinder, for example, and replace the chain or utilize the timing device usually provided for the work. At Fig. 2 is shown the silent chain drive used on a Knox motor, and it will be seen that two chains are employed, one for driving the camshaft and the other for actuating the magneto shaft. Both are driven from a sprocket on the crankshaft. The timing of the camshaft is accomplished by means of a vernier coupling, shown in the illustration, while the magneto coupling is fitted with a notched connection. These constructions permit of very accurate setting.

Silent types of chains operate in a bath of lubricant, and the use of wide members and coarse pitch provides an ample factor of safety as well as wear. It has been demonstrated abroad, where the silent chain has been in vogue for some time, that it will run for several thousands of miles without showing any appreciable wear.

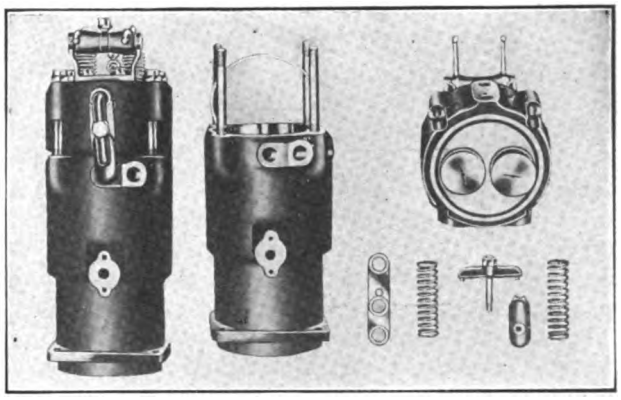

Fig. 1—Showing the Construction of the Knox Type of Detachable Cylinder Heads, Making for Accessibility and Convenience.

It is held by some makers that no adjustment is required with silent chain drive, as it will mesh properly with the chain wheel teeth whether it fits tightly around the chain wheels or whether the chain teeth engage only the outer ends of the wheel teeth.

The subject of chain drive and its adjustment is treated in a booklet published by Hans Renold, Ltd., of Manchester, England, and two methods of compensating for wear, etc., are reproduced at Fig. 3. At A is presented the method adopted by the manufacturer of the Gregoire car. Here two eccentric bushings are employed, one within the other. Assuming that both bushings have the same eccentricity, moving them equal angular distances in opposite directions will

Digitized by Google

cause the magneto axis to be moved in a straight line, which will be horizontal if the eccentrics are properly set in the first place.

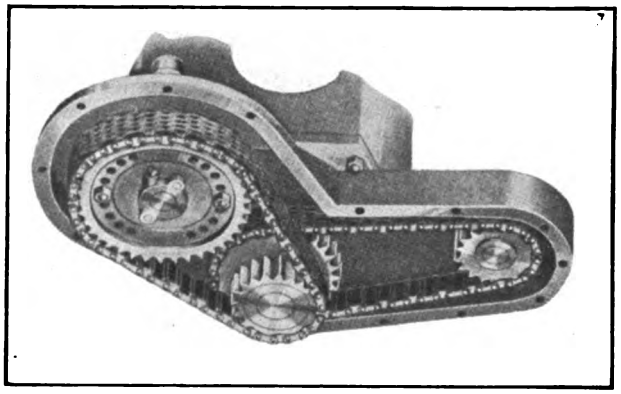

Fig. 2—Vernier Coupling for Timing of Knox Camshaft, Also Notched Connection Employed with Magneto Drive.

The idler wheel method is also utilized, one of this type, that fitted to Belsize motors, being shown at B. This is better employed with roller than the silent chain types. The idler wheel is pressed against the roller chain by means of a spring. The idler may also be moved by an eccentric. Sliding bearings are also used, and this form makes for simplicity. When employed for driving the magneto the bracket retaining the latter is normally locked in position by three holding-down bolts riveted through the casing and passing through slots in the head of the bracket. This end of the bracket also includes the bearing for the magneto shaft. An adjustment screw is provided, it passing through metal which is divided along the length of the screw by a saw cut right through. Consequently when the nut of the adjacent clamping bolt is screwed down the surrounding metal is pinched on the screw member, locking it. Loosening a nut frees the screw, which, in being screwed in, bears against the rigid bolt, drawing the bearing and magneto bracket outward together.

Patching Inner Tubes.

(1617)—Am not an experienced motorist, having purchased a car recently, but have had my troubles in the shape of punctures. A tire repairing kit came with the machine and although I believe I followed directions in using it, have been unable to get a patch to stick. They work loose, especially when driving on a hot day. Is it the fault of the cement or the method of application? I note an advertisement in your paper about a vulcanizer that is automatic and can be used by anyone. Will you please give me the benefit of your experience in using such a vulcanizer? NEW OWNER.

Glen Ridge, N. J., July 14.

It is contended by some authorities on tires that it is difficult to apply a patch with cement and have it hold when subjected to the heat developed by the car driven at excessive high speeds. On the other hand, the writer has patched inner tubes with plain patches and cement and obtained satisfactory results. In one instance a tube repaired in this manner has been in service three seasons without the patches leaking.

In patching it is important that both the surface of the tube and that of the patch be perfectly clean, and better results are obtained if the surfaces are roughened. A first class cement is imperative and it should be allowed to dry until in a state known as "tacky." After applying the patch the section repaired should be placed in a press. One can be made of two blocks of wood and a clamp. The usual cause of a patch not holding is that sufficient time is not allowed for the cement to dry.

While tubes may be repaired as above described, the better method is vulcanization. Formerly the motorist was obliged to rely upon the tire repairman, as vulcanizing outfits involved the expenditure of a considerable sum of money, as well as a knowledge of the use of the apparatus. There are, however, a number of inexpensive vulcanizers marketed that are automatic in their action and with which the owner can complete repairs. The majority employ gasoline as fuel, the operation involving no other work than clamping the vulcanizer over the puncture, which is treated with a rubber preparation, and the fuel ignited. There are a large number of owners who utilize these vulcanizers, enabling repairs to be completed on the road as well as in the garage, and at the cost of a few cents for each operation. The subject of vulcanizers was discussed in the July 10 issue of The Automobile Journal and several types were illustrated.

Experiencing Oiling Trouble.

(1618)—I am and have been experiencing for some time considerable trouble with oil in my 1910 Ford. I find it almost impossible to carry the amount of oil to insure safety, and in view of this fact am writing you if the Pederson oiling system would in your opinion help me in my difficulty. This system consists of a pump at-

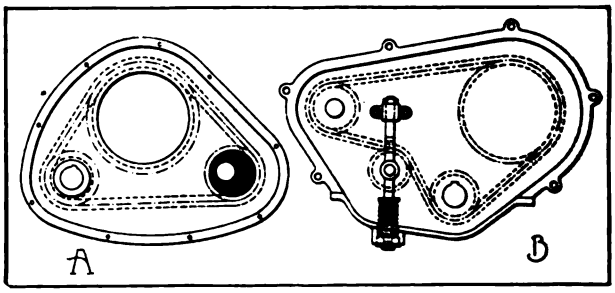

Fig. 3—Adjusting Silent Chain Drive: A, Eccentric Bushings Employed on Gregoire Motor; B, Idler Utilized with Roller Chain on Belsize Engine.

Digitized by Google

tached to the timer shaft, a sight feed on the dash with an adjustment, and a reservoir which holds a gallon of oil. W. B.

Bristol, R. I., July 15.

The oiling device referred to was designed especially by the company for the make of car in question, and the writer understands that it has been fitted with success by a number of Ford owners. As it is possible to regulate the amount of oil being fed to the crankcase, and as the speed of the pump proper is proportionate to that of the motor, there is no reason why, if the feed is adjusted properly, the system should not provide satisfactory results. The maker of the device will forward details of the system on request.

Faulty Lubricator.

(1619)—Am experiencing trouble with the oiler on my car. I believe it is an Essex, as I noted one illustrated in a catalogue which appears very much the same. A pipe leads from the exhaust manifold to the oiler, and a large pipe carries the oil to a glass sight feed on the dash. The oil stopped dropping the other day and although I opened up the feeds, no oil dropped. What is the cause and how can it be repaired? SUBSCRIBER.

Lyons, Ia., July 16.

There are three principal causes for failure of the system to operate properly. First, a leak between the exhaust pipe or other tubes, pressure pipe clogged, or the check valve stuck. In the system referred to the pressure of the exhaust gases are led to the oil reservoir by a pipe and the pressure causes the lubricant to be forced out through the main oil pipe leading to the sight feed members. Here it is regulated by a needle form of valve. The usual cause of trouble with the system is the employment of too much oil; that is, too large a quantity is fed to the cylinders, resulting in carbon and soot, which not only clog up the pressure pipe, but the check valve. The latter is employed to allow the pressure to enter the reservoir, but not to escape. The valve may be cleaned easily by removing the nut member. It may be of the ball or cone type. Be very thorough in cleaning the part. It is also an excellent idea to remove the feed pipe from the exhaust and clean this. It will usually be found to be more or less clogged with soot, this depending on conditions.

All connections should be tested for leaks and set up snugly. This will not be necessary unless the system fails to operate properly after cleaning the pipe and valve. In testing for leaks, the motor should be run and by squirting oil on the connections any loss of compression will be noted by the bubbles given off. If leaks exist around the glasses, care should be taken in tightening these members, as they are easily broken. It is possible that the filler cap of the reservoir may not seat properly, in which event it may be remedied by making a new leather washer. The system gives good results, but when considerable oil is utilized the check valve will require some attention.

Skipping Motor.

(1620)—Am troubled with my motor skipping when on the magneto and when the car is running on the high at very slow speds. It does not miss when on the batteries. Is the magneto at fault and if so what is the trouble? W. H. G.

Columbus, O., July 17.

The fact that the motor operates properly on the batteries and misses on the magneto would indicate that the gaps of the plugs were not set correctly. As the type of magneto or ignition system was not mentioned it is difficult to give other than what might be general causes. If the magneto is of the dual type; that is, the current from the batteries is distributed from the magneto, and but one set of plugs is employed, the gap trouble referred to is possible. The gap should be set in accordance with the instructions of the maker of the magneto. If the plugs are ordinary members and have been used for a considerable period, it is possible that the points are burned away, increasing the gap. This subject is treated elsewhere in this issue. It should be remembered that a smaller gap is required with the magneto supplying current, particularly at low motor speeds.

Inflation of Tires.

(1621)—I read an article on the inflation of tires in your book and do not agree with the author of the story when he states that tires should be pumped up as hard in the summer as in the winter. All motorists know that a tire gets harder after a run on a hot day and that there is a gain in the pressure. I make it a practise to blow my tires up within 10 pounds of the pressure recommended by the maker, and I am obtaining more than the 3500 miles guaranteed by the maker.

OLD MOTORIST.

Boston, Mass., July 19.

The article referred to by the reader was based on the recommendations of prominent tire manufacturers whose experience cannot be questioned. The fact that one obtains durability with a set of tires inflated to less pressure than that recommended by the maker may be due to the car being light, over tired or easy on shoes. The nature of the roads traversed and rate of speed are also factors to be considered.

The writer has had considerable experience with tires and has found that decidedly more mileage was obtained with tires pumped to pressure than under. In one instance two new shoes were fitted to the rear wheels, the right hand casing being properly inflated, while the left was 15 pounds less. Although the right hand wheel is held to be subjected to more stresses, considerable more mileage was obtained and under equal conditions of service.

WITH THE MOTORING INTERESTS ABROAD.

Georges Boillot Wins French Grand Prix for the Second Consecutive Time with Peugeot Car—Foreign Manufacturers Confer Respecting American Invasion.

GEORGES BOILLOT, in a Peugeot car, won the French Grand Prix the second consecutive time July 12, covering the 569 miles in 7:53:56. Jules Goux, winner of the third annual 500-mile race on the Indianapolis motor speedway, was second, also with the Peugeot, his time being 7:56:22. Chassagne, driving an English Sunbeam was third.

No American cars or drivers were entered this year. In 1912 the race was for 956 miles, and occupied two days, one-half of the distance being covered each day. Boillot's time was 13:58:02. The late David L. Bruce-Brown, in a Fiat, was in the lead at the close of the first day, but he was disqualified during the second day for taking on gasoline outside of the regular pit. In point of time Bruce-Brown finished the contest in third place. Wagner in a Fiat was second and third award was given to Rigal of England in a Sunbeam.

Georges Boillot and Peugeot Car with Which He Won French Grand Prix for the Second Consecutive Time.

It will be seen that Boillot's speed this year was 70.78 miles an hour, as compared with 68.45 in 1912. The world's road race record is held by Teddy Tetzlaff, who won the Santa Monica event of May 4, 1912, with a Fiat, at an average speed of 78.5 miles an hour. This is of interest in view of the superiority claimed for French roads.

Five countries were represented in this year's Grand Prix, these and the makes of cars for each being as follows: France, Peugeot, Delage, Schneider; England, Sunbeam; Germany, Opel, Mathis; Italy, Itala; Belgium, Excelsior.

THE AMERICAN INVASION.

European Manufacturers Hold Important Conference in Switzerland.

That the so-called American invasion is giving European motor car manufacturers no little concern is still further demonstrated by the recent conference of makers representing Great Britain, France, Germany, Austria and Belgium in Geneva, Switzerland. The meeting also served to reveal the organization of the Union of International Automobile Constructors, with which it would appear that the American manufacturer was hardly expected to become identified.

The main topic of discussion at the conference was the invasion of the European market by the low priced American automobile, and while it was at first suggested that measures should be adopted to check this movement, it finally was decided that in the excellence of the European products lay the only reply that could be made. It was explained, after the meeting, that no competition in low priced machines was proposed, for the reason that none was found to be possible.

In this connection, it is of interest to note that Russian bankers have come to the assistance of American importers by inaugurating an automobile department, which is to be handled in the same manner as has been the implement business. The large banks in Russia are represented by numerous branch houses throughout the empire, and it is through these that the dealer is able to do business without coming in direct touch with the producer. It is understood that several American manufacturers are making arrangements with Russian banks for the handling of their product.

THE INDUSTRY IN JAPAN.

American Machines Much in Demand, but Cars May Be Produced There.

With the widening and improvement of roads and bridges in Japan, the importation of automobiles continues to increase. A large number of foreigners in that country buy motor cars, the nationality of the purchaser determining, as a rule, the make of machine. Many of the more wealthy Japanese are also making use of automobiles, and this, together with the tourist trade, has resulted in a proposition to enter the manufacturing end of the industry. Already various parts are being produced.

Of a total value of $445,406 placed on automobiles and parts thereof imported into Japan during 1912, the United States contributed over 50 per cent., the returns by countries being: United States, $251,678; Great Britain, $108,911; Germany, $31,093; others, $53,724.

OVERLAND IN PHILIPPINES.

Automobile Has Played an Important Part in the Development of the Islands.

The people of the Philippines have seen some remarkable innovations since the United States wrested the control of the islands from Spain in 1898, and undertook the task of preparing the inhabitants for self-government. Habits and customs that dated back for centuries have been changed or abolished. The entire mode of living has undergone a transformation. Children who formerly received their education from the jungles now pursue their studies in modern American schools presided over by American teachers. And the introduction of the automobile has played its part in this development.

An accompanying illustration shows a number of Filipino young people enjoying a drive on a Luzon highway in an Overland car, made by the Willys-Overland Company, Toledo, O. The photograph is particularly interesting in its comparison of the modern with the ancient, the latter being represented by the flimsy bamboo huts with roofs thatched with grass, exactly the same in material and architecture as those built hundreds of years ago. However, the picture is not as uncommon to the residents of the Philippines as to Americans who have never visited the islands, and automobile dealers in Manila state that motor cars are now almost as numerous as bullock carts in Luzon and are rapidly becoming the popular pleasure vehicle of the whole country.

NOTES FROM FOREIGN LANDS.

The total value of imports of automobiles and parts into the South African Union increased from $1,800,493 in 1911 to $2,812,467 in 1912. America made a good showing, the figures advancng from $208,130 to $700,800. About 240 American machines were sold during the year in the Transvaal, and there is said to be an unusual demand for cars selling at $1000 to $2500.

Carlos de Salamanca, driving an English Rolls-Royce, won the 192-mile Spanish Grand Prix, over the Guadarrama mountain course in Spain, last month, his time for the distance being 3:34:12. Marquis de Aulencia with a Lorraine-Dietrich was second in 3:37:04, and C. Eric Platford with a second Rolls-Royce was third in 3:39:56. Out of a total entry of 20 cars 17 started and 11 finished.

Owing to the lack of entries, only two makes of cars having been represented thus far, the Belgium Grand Prix has been postponed until Aug. 24-25, and the date for receiving entries has been extended to July 31. It is understood that the course will be changed somewhat, so as

Party of Filipino Young People Enjoying Roads of Luzon in Overland Car.

to permit of using roads which can be rendered dust proof and free from the possibilities of danger.

It has been definitely decided to hold the 1913 Paris Salon Oct. 17-27, instead of during the month of December as formerly. This action is being variously interpreted in Great Britain, where the annual Olympia show will be held in November. The most generally accepted view, however, is to be found in the suggestion that the French manufacturers hope to restore the former prestige of the Salon by holding it well in advance of the exhibitions in other countries.

According to Consul-General Charles A. Holder, Christiania, Norway, there is a large and active demand for motor fittings, at present supplied by England, United States and Germany, in the order named. A few are made in Norway, but their high price makes the sales limited. Several dealers state that they would be glad to buy American fittings, as they consider them superior to those of any other country, but no manufacturer seems interested in this market and none has taken the trouble to investigate its possibilities. Those most in demand are grease cups, oil cups, oilers, unions, pipe fittings, couplings, check valves, water outlets and exhausts and priming cups.

IN THE COMMERCIAL VEHICLE FIELD.

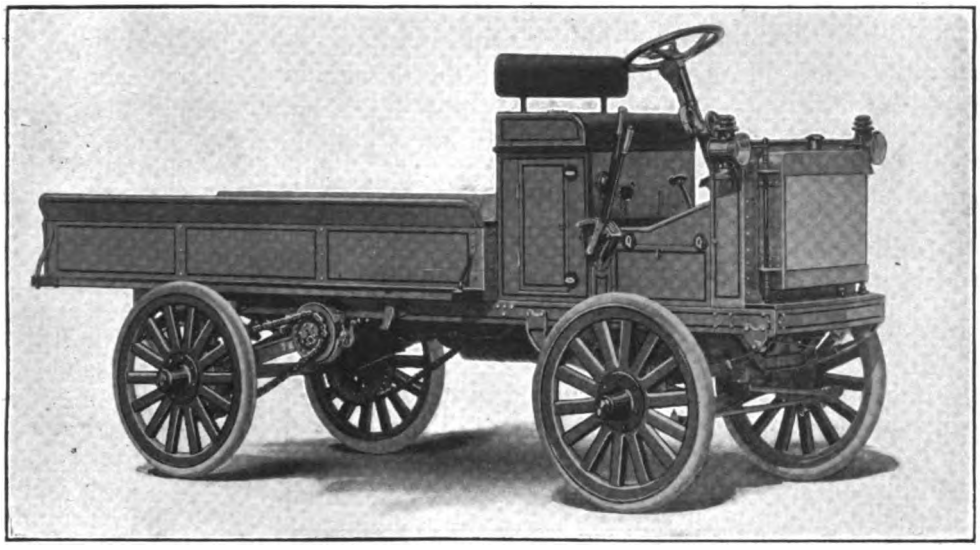
Constructional Details of the Marmon Delivery Wagon---New Model Placed in the Market by Sanford Company---Features of Moore Two-Cycle Engine.

HAVING been engaged in the production of pleasure cars for years and in machine manufacturing for three generations, it is but natural to assume that the Nordyke & Marmon Company, Indianapois, Ind., would not have entered the commercial vehicle field with its 1500-pound Marmon delivery wagon until it was prepared to demonstrate that it was well adapted for the purposes for which it was intended. The design follows standard practise insofar as the principles are concerned, and the proportions of the various components and the workmanship are quite in keeping with the product of this concern.

The motor is typical of Marmon design and construction, but differs from that used in the pleasure cars of this name in that it has a bore of four inches and stroke of five inches, the horsepower rating being 25.6 under the S. A. E. formula. It is of the T head, four-cylinder, water-cooled type. The water jacket is large and the valves and ports are designed to insure sufficient charges of fuel and complete scavenging of cylinders. The crankcase is a barrel form without supporting arms, which is held to make for accessibility and permit work and attention with minimum labor on the water pump, magneto, carburetor, oil pump and connections.

Marmon 1500-Pound Delivery Wagon with Open Express Body Equipment.

The lubrication is positive and has been tested for years in Marmon cars. Ignition is by a high-tension magneto and battery, a dual system using one set of plugs over the intake valves. The carburetor is of the automatic float feed type and may be adjusted from the dash. The motor is governed by the automatic control of a valve in the fuel intake to a speed of 20 miles an hour.



The clutch is a cone with the wide face covered with asbestos fabric, and with a series of springs beneath the facing to prevent harsh engagement. The transmission is selective, affording three forward speeds and reverse, and is assembled with the differential. The rear axe is a full floating construction with a pressed steel trussed housing, this being the Marmon standard design, the wheels being carried on the ends of the housing and driven by shafts bolted to the outer flanges of the wheel hubs. The front axle is a forged steel I section. The frame is a pressed steel channel section with heavy cross frame members, well reinforced with gussets. The forward springs are semi-elliptic and the rear full elliptic. The brakes are an expanding type, operating within pressed steel drums on the rear wheels. The wheels are of wood artillery type, 34 inches in diameter, and are shod with 34 by four-inch pneumatic tires. An option of solid tires, or single or dual members at the rear, is permitted. The driver is placed at the right, with control at the right.

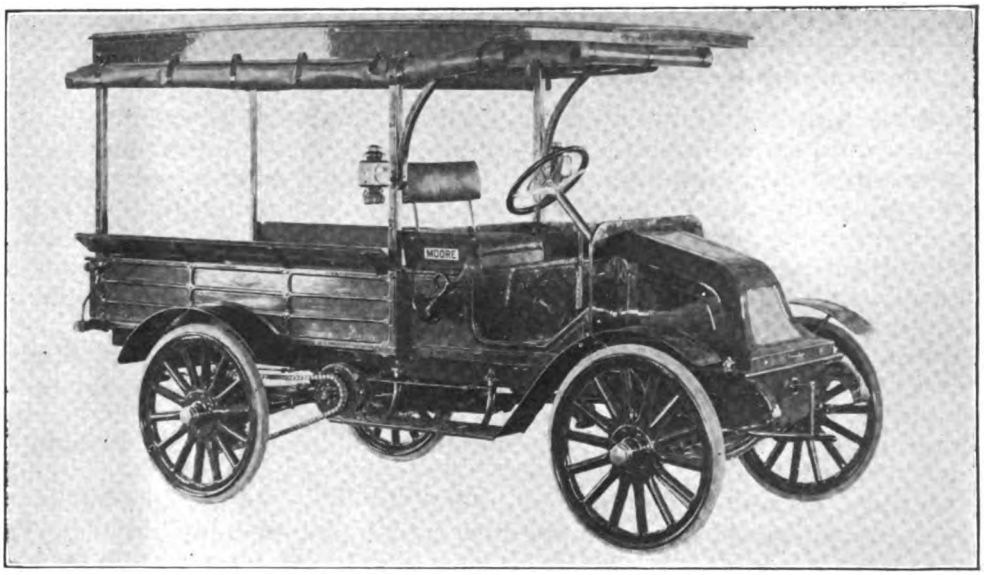
NEW SANFORD MODEL.

Delivery Wagon of 3000 Pounds Capacity Added to Well Known Line.

Developed to meet a demand for a machine of larger carrying capacity than the older model K, the Sanford model L delivery wagon of 3000 pounds capacity, has been brought out by the Sanford Motor Truck Company, Syracuse, N. Y.

Digitized by Google

Sanford Model L Delivery Wagon with Capacity of 3000 Pounds.



The model K is a 2000-pound wagon and the new machine is identical with it, aside from the proportions.

The power plant is a unit, the motor, clutch and transmission being assembled together. The engine is a four-cycle, four-cylinder, water-cooled L head type, with the cylinders cast in pairs. The bore is four inches and the stroke 4.5, giving a rating of 25.6 horsepower under the S. A. E. formula. The valves are on the left side, and the stems, tappets and guides are protected by cover plates that may be removed readily for inspection or adjustment. Lubrication is by combined force feed and splash, oil being drawn from a two-gallon reservoir in the base of the crankcase by a pump driven off the camshaft, and being filtered before it is circulated. Ignition is by a high-tension magneto. The carburetor is an automatic float feed type and the motor is fitted with a governor.

A large extension at the rear of the engine case houses the flywheel and clutch, and to this is bolted the housing for the transmission gearset. The clutch is a multiple disc, 16 crucible steel plates, hardened, tempered and ground. The transmission is selective, affording three forward speeds and reverse, the shafts being of large diameter and mounted on annular ball bearings. An interlocking device prevents the use of more than one set of gears at a time. The drive is to the jackshaft by shaft, and thence by chains to the rear wheels.

The frame is of steel channel section, and is supported by semi-elliptic springs all around. The rear axle is of heavy rectangular section and the forward member an I section. The service brake shoes operate with contracting bands on drums on the jackshaft and the emergency members are external contracting on rear wheel drums. The wheels are 36 inches in diameter and are fitted with 3.5-inch tires in front and four-inch at the rear. The driver is at the right with right hand speed changing and emergency levers.

All Sanford wagons are the development of nine years' experience, those engaged in their production having been associated with some of the oldest concerns in the automobile industry.

Moore Delivery Wagon, Capacity 1600 Pounds, with Standard Express Body.

MOORE DELIVERY WAGON.

Special Feature Is Three-Cylinder, Two-Cycle, Air-Cooled Motor.

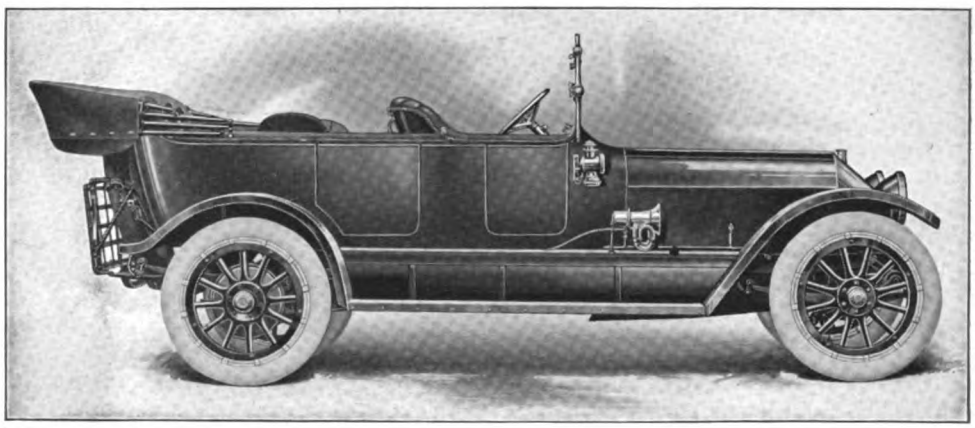
Utilizing what appears to be conventional design, with the motor in front under a French type hood, the 1600-pound Moore delivery wagon, made by the Palmer-Moore Company, Syracuse, N. Y., demonstrates that appearances are deceptive. The car is decidedly distinctive in the use of a three-cylinder, two-cycle, air-cooled engine of entirely original design. The wagon is the first to be produced by this concern, but other sizes will be built as soon as manufacturing plans can be completed.

It is maintained that the Moore motor differs from all others of the two-cycle type in that it has a control by rotary port shutters to give variable speed. The cylinders are the three-port type, and each port has three rows of holes staggered in arrangement, the holes of the intake being smaller than those of the exhaust. Each port has a rotary shutter, so fitted that any series of holes may be covered or uncovered. For instance, the shutter may be placed so as to vary the fuel supplied from one extreme to the other, and as this shutter is moved the shutters of the exhaust port and by-pass are varied similarly, each shutter registering the same with reference to position. Because of the three rows of holes in each port the motor is said to have three speeds by change of fuel supply, these being the low, intermediate and high.

Rotary Port Shutters of Moore Two-Cycle Engine, Showing Operating Mechanism.

It is claimed that the speed may be regulated in this manner so as to eliminate possibility of irregular firing or back firing at low speeds, and to insure against loss of power at high speeds. The valves are operated by gear segments and bell cranks connected with a lever carried on the steering wheel, and the gear segments are made so that they will mesh in one position only. The shutters are installed with cover plates that may be removed easily for inspection or work.

The bore and stroke are the same, four inches, and the cylinders are cast with the heads integral with the combustion chamber in a half-spherical form. The head has wide longitudinal fins that converge at the top and unite with a horizontal fin, and below this is a series of fins that extends nearly to the bottom of the cylinder. Each member is cast separately and they have heavy base flanges. Lubrication is by oil mixed with the fuel in the proportion of one quart to five gallons of gasoline. The carburetor is of special construction, there being a fixed adjustment. Ignition is by Bosch high-tension magneto.



The clutch is a multiple disc. The drive is through a shaft having two universal joints carried in a self-aligning annular ball bearing mounted in a centre cross frame member. The transmission is planetary, affording one speed forward and reverse, there being an interlocking device so that it is impossible to engage either without disengaging the ratio in use. The jackshaft is a special type and is so mounted with the gearset as to be suspended at three points. Drive to the rear wheels is by side chains.

The frame is a pressed steel channel section with large cross members. Springs are semi-elliptic all around. The axles are drop forged from vanadium steel, and are I sections. The brakes operate on 10-inch drums on the jackshaft and rear wheel hubs. Both sets are equalized and are easily adjustable. The wheels are artillery type, fitted with 36 by 2.5-inch tires in front and 36 by three-inch rear. The driver is at the right.

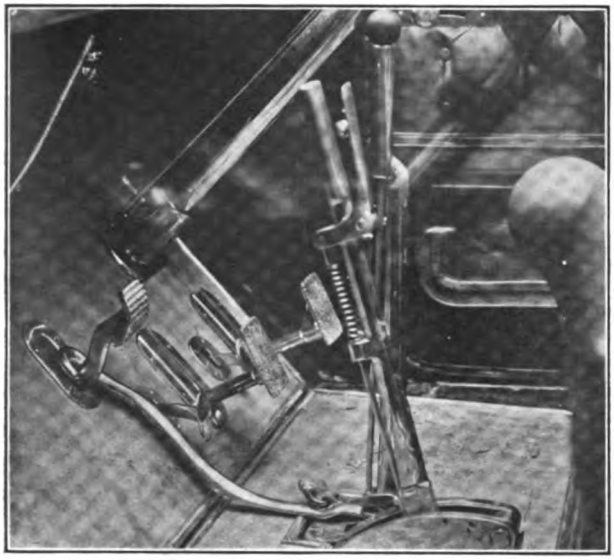
KNOX COMPANY ANNOUNCES 1914 LINE.

FOR 1914 the Knox Automobile Company, Springfield, Mass., one of the oldest motor car manufacturers in the country, finds it necessary to make only minor improvements and refinements in the four chassis which will be continued. All of these will be produced in a large number of body type, each with fore doors, even the limousine and berline having the driver enclosed. In addition to the types previously offered is the Prince Henry or streamline design, which will be constructed in four, six and seven-passenger capacities for the Knox Little Six chassis only. The company has discarded the acetylene motor starter, and will equip its entire product with the Esterline electric lighting dynamo and motor starter. A wide variety of finish in standard colors is offered, including natural wood grain, which is listed as slightly extra, and the factory is equipped to paint cars in special colors if desired. In thus allowing the buyer a width of preference the Knox company is but following its policy of previous years in giving what the public wants, instead of endeavoring to force some particular type, size or feature upon it.

New Prince Henry or Stream Line Type of Body Which Will Be Fitted to 1914 Knox Little Six Chassis in Four, Five and Seven-Passenger Capacities.

The 1914 product will comprise two four-cylinder chassis, known as models 44 and 45, with wheelbases of 122 and 126 inches respectively. Model 46, the Little Six, is rated at 46 horsepower, while model 66 is equipped with a six-cylinder, 60 horsepower motor. Both sixes have a wheelbase of 134 inches. The body designs include two, three and four-passenger raceabout, torpedo, touring, limousine and berline.

The unit power plant with flexible three point suspension is continued as well as the detachable cylinder heads with valves in the head and the latter are enclosed on the Little Six. The cylinders of the four-cylinder models are cast separately, those of models 46 and 66 being in pairs.



The Knox motors are the result of careful study and exhaustive road tests, and are noticeable for their simplicity, accessibility and economical operation. The same careful workmanship and high grade material are incorporated in each model, and as these differ only in the bore and stroke, and strengthening of those parts to care for the larger horsepower production, a general description of the power plant will suffice. Details of the motors are given in an accompanying table.

The valves are located in the cylinder heads without cages, and are thus assured thorough cooling by the circulation water. Machined and polished combustion chambers prevent carbon deposits. The valves are operated by rocker arms and tappet rods, rising from the camshaft. The cylinder head is detachable, four bolts serving to retain it firmly in position, while a copper-asbestos gasket makes the joint gas tight. The water jacket is cast integral with both parts, the cooling fluid entering at the lowest point and having its outlet near the top. The head joint is not for water at all, the latter being led into the upper portion by an external fitting. The pump is of the centrifugal type, having a safety coupling to prevent damage from freezing or clogging.

SPECIFICATION DETAILS OF KNOX 1914 MODELS.

	H. P.					Forward			Lighting and			Wheel-	
	Cyl.	S. A. E.	Bore	Stroke	Clutch	Trans.	Speeds	Drive	Ignition	Starting	Rear Axle	base	Tires
Model 44	4	40	5	5½	3 plate	Selec.	3	Bevel	2, Indpt.	Elec.	Full Floating	122	36x4½
Model 45	4	40	5	5½	3 plate	Selec.	3	Bevel	2, Indpt.	Elec.	Full Floating	126	37x5
Model 46	6	46	4⅜	5½	3 plate	Selec.	3	Bevel	2, Indpt.	Elec.	Full Floating	134	38x5

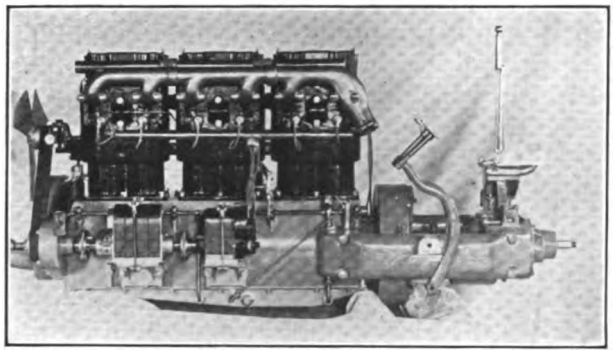
Knox Centre Control with Device for Locking Motor, Starting Pedal and Gearshift Lever—Note Sliding Grommets in Toeboard, Preventing Entrance of Heat into Fore Compartment.

Knox crankshafts are made from a high grade alloy steel, carefully heat treated and accurately ground to size. Both main and crank bearings are liberal in size, made of a special Fahrig metal, and are run in until a mirror like surface is obtained. The pistons are machined and ground and are fitted with three rings above the wristpin and an oil ring at the bottom. The connecting rods utilized on the four-cylinder models are of the round type, drilled out in the centre and fitted with a small oil tube, leading the lubricant to the wristpin from the main bearing. Those on the six-cylinder motors are of the I beam type, a forging and have an oil channel. The wristpins are hardened and ground and have bronze bearings.

The camshafts are cut from a solid bar of tough alloy steel with integral cams and two integrally cut spiral gears drive the water and oil pumps and timer. A silent chain drive is utilized on the Little Six. The chains are unusually wide and, of course, pitch, and are thoroughly stretched before assembling. They operate in a constant bath of lubricant. Timing of the camshaft is by a vernier coupling, while the magneto coupling has a notched connection, simplifying timing without removing the chains, as well as insuring accuracy of valve operation. The valves are made from a solid piece of nickel alloy steel and have large porportions, preventing undue warping, and insuring a good seat at all times. They are operated through tappet rods and rocker arms placed overhead. The upper ends of the former, as well as of the valve stems, being provided with a cup-shaped socket to receive the hardened tips of the rocker arms. In these cups oil is placed, making the action more nearly noiseless, as well as minimizing wear. In addition to the usual valve spring, an auxiliary is utilized for taking up lost motion, so as to render the whole efficient and quiet at all times.

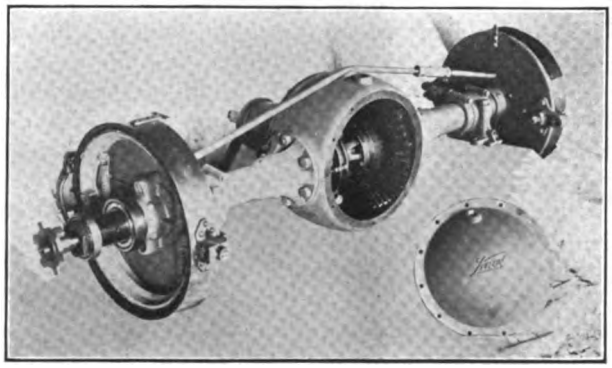
The power group forms a unit with the clutch housing and transmission, this being supported in the frame from three points. Two supports are placed in the middle of the side arms and the single connection at the front. The latter comes at the centre of the crankcase, while the former are located just back of the flywheel. Not only are the advantages of the three point suspension obtained, but the situation of the supports is such that they come close to the units of the heaviest duty or weight. The Knox practise of having each unit removable by displacing a few bolts is continued, and each of the components may be taken out individually with an equally small amount of work.



The clutch used on all Knox models is of the three-plate dry type with cork inserts, possessing the essential qualities of gradual and easy engagement, efficiency and durability. The clutch enclosure within the flywheel insures the exclusion of foreign elements. The transmission is simple and quiet operation is insured by the use of spiral gears in the main driving set. It is of the selective type, providing three forward speeds and one reverse, and the span between the bearings of the main shaft is such that maximum

Berline Enclosed Type of Body Fitted to Knox Model 45 Four-Cylinder Chassis.

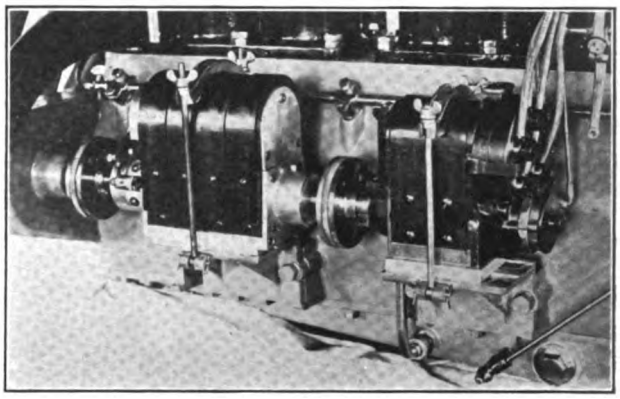
Digitized by Google



LIBRARY OF THE UNIVERSITY OF CALIFORNIA

Left Hand Side of Knox Little Six Power Plant, also Showing the Unit Construction and Accessibility of Components.

strength is assured. Shafts and gears are of alloy steel, the latter being hardened, while the former are made with integral flutes. Imported annular ball bearings are used throughout. The absence of nuts, bolts and cotter pins is noticeable within the case.

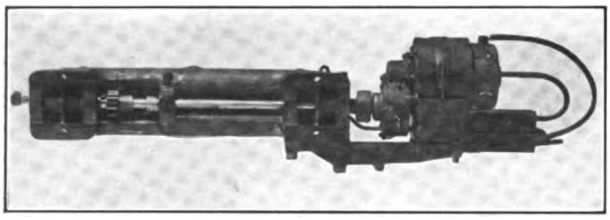


The Knox oiling system is of the circulating type and includes a simple gear pump driven from the camshaft. The lubricant is drawn from a crankcase supply, filtered, forced through a main pipe along the side of the case and separately lead to the crankshaft and camshaft bearings. From the latter, oil holes in the shaft and grooves in the connecting rod bearings, lead it to the rods, holes in which carry a supply up to the piston pins, bushings and cylinder interiors. In addition, the latter surfaces have the mist from the splash within the case. All oil is returned to the reservoir, filtered and used over again. This makes an efficient and economical oiling system with a minimum of parts. It is stated that an average of 800 miles to a gallon is obtained with the four-cylinder motors and 700 miles with the six-cylinder types. A gauge indicates the pressure at all times, and may be varied by a bypass valve. All screens are very accessible for cleaning and a petcock is provided for noting the height of the supply.

Side View of Rear End of Knox Little Six Chassis, Showing Arrangement of Brakes, Torsion Rod and Spring Suspension.

Two independent ignition systems are provided, these including a Bosch high-tension magneto and a four-unit coil, timer and battery, or distributor and motor vibrator on models 44 and 45. A Bosch magneto, distributor and battery are employed on the six-cylinder units.

Final drive is by shaft to a full floating rear axle, a universal joint being located at each end of the former to take care of any lack of alignment. The axle is of large proportions and the housing of the four-cylinder types is of pressed steel to which the tubular ends are acetylene welded, while that of the six-cylinder models has heavy gauge tubular axle ends, bolted to a central housing of cast steel by means of integral flanges. Both axles are trussed by a tierod underneath. The differential and bevel drive are



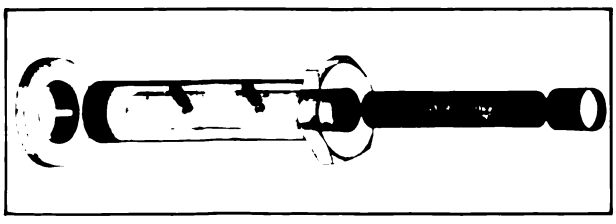
Showing Location of the Lighting Dynamo and Magneto and Method of Drive.

mounted on a steel casting, an integral unit, and a large inspection plate permits the withdrawal of the gears, while a micrometer adjustment is provided for setting the gears and bearings. The gears are of generous size, made from alloy steel, and the pinion bevel is made integral with its shaft, the material being an alloy steel drop forging. High grade imported ball bearings are employed and radial thrust bearings are provided on the bevel drive of the six-cylinder models, in addition to annular ball types.

The front axle is of the I beam section type, the material for the bed being an alloy steel, drop forged and heat treated, while the pivot levers are of the same material. The knuckles turn on Timken roller bearings, which are arranged to take all thrust, as well as provide means for making adjustments. The wheel bearings are of similar form.

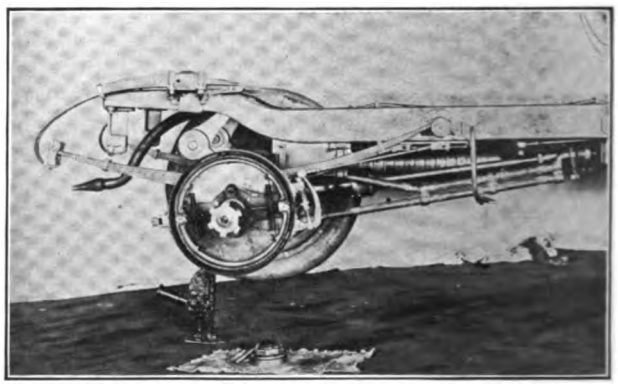
The brakes of all models are located on the rear wheel hubs, the service members being of

Digitized by Google



Showing Construction of Knox Electric Motor Starting Unit, Making for a Simple and Direct Application of Energy.

the contracting band type and the emergency of the internal expanding design. With the four-cylinder models the internal brake shoes act directly against the inside of the foot brake drum, adding considerably to its efficiency. The brake supporting brackets are securely anchored to the axle tubes, brake reaction being transmitted to a torque truss attached to the centre of the axle and spring supported on a cross member of the frame. The adjustment is simple. That of the service members is obtained by shortening a connecting link, while wear is compensated for with the emergency by turning the fulcrum cam slightly between the shoes.



Semi-elliptic front and three-quarter scroll ended elliptic springs in the rear are used on all models, the front being 42 inches long. The rear members of models 44, 45 and 66 are 50 inches long, those of the Little Six 54. The lower members of each are rather flat, while the scrolls are comparatively long. They are of a tough, alloy steel with nickel components, and provide maximum comfort with stability and safety. All spring bolts are thoroughly lubricated by grease or oil. On the Little Six an ingenious method of lubricating the bolts is provided. It consists of a felt wick soaked in oil and forced into the spring bolt. The lubricant oozes through small wicks in the bushings, insuring efficient lubrication.

The Knox steering gear is continued. It is of the irreversible type operated by a double right and left hand threaded screw mechanism which reacts on a rocker located in the base of the housing. All road shocks are cushioned by a spring joint at the forward end of the fore and aft connecting rod, and throughout the best material and workmanship are incorporated. The stability of the Knox steering mechanism has been proven in service. Provision is made for compensation for wear. Both the spark and throttle levers are mounted on the top of the steering wheel on a stationary bracket.

Knox Method of Lubricating Spring Bolts of Little Six—Oil Soaked Wicks Insure Copious Lubrication.

The company points with pride to its frame, which is an unusual piece of workmanship and material. The flanges of the side parts widen rapidly from the attachment of the front spring shackle, and thence continue straight back with unusual width until past the point of power unit attachment. Thence the taper back to a usual section is gradual, being distributed over three feet or more. In side view, the frame is of full depth from the front axle back to the up-sweep at the rear. This design makes a unit which possesses great strength, without any unnecessary weight. There are three cross members, one at

Full Floating Type of Rear Axle Employed on Knox Little and Large Six, Having Large Inspection Plate and Micrometer Adjustment of Gears and Bearings.

the extreme front, just ahead of the crankcase end, another at the rear, where it unites the side members, and a third at the middle joint. The last named is just above the first universal joint in the driving shaft, and carries the forward extremity of the torque rod. The two motor supports also form cross members, in the sense of stiffening the frame.

The wheels are of the artillery type with spokes of second growth hickory, and Fisk demountable rims are standard equipment, although option is given of universal and clincher. The tire sizes are as follows: Model 44, 36 by 4.5 inches; model 45, 37 by five; model 46, 38 by five; model 66, 38 by 5.5.

Centre control is utilized on all models and option is given of right or left position of the steering column with the exception of the small four-cylinder models. Provision is made for locking the gear shift lever and motor starting pedal. The latter is located in the centre of the car. The

Digitized by Google

order of the control members from left to right is as follows: Starter pedal, cut-out pedal, clutch, accelerator, service brake pedal on cars with right hand steer. Entrance of heat from the power plant through the toeboard is prevented by sliding groumets over the openings for the clutch and brake pedals.

The electric motor starter, which replaces the acetylene on all 1914 models, is the Berdon. The unit is mounted on one of the engine legs which extends from the motor to the transmission, and drives directly on the flywheel through a sliding pinion shown in an accompanying illustration. This provides a direct method without the employment of spiral or bevel gears. It is pointed out that it may be readily disassembled and assembled by displacing one of the engine legs. The lighting dynamo is a Berdon, which is located, as is the Bosch magneto, on the left hand side of the power plant.

The large number of bodies produced are manufactured in the Knox plants, and are of sheet aluminum and steel panels on a strong wood frame. The upholstering is of carefully selected hand buffed leather, either black or colors to match the painting or special cloth. Option is given of nickel or brass trimmings. The colors include battleship gray, brewster and thistle green, royal blue, wine, maroon, dark carmine, Knox red, tan and chocolate brown. Mahogany, French, Circassian walnut or mission natural wood finish is listed as extra. The finish is in keeping with the high standard maintained by the company, and the equipment is very complete, including every convenience for operation and comfort.

DETROIT'S ROAD CONGRESS.

Brief Outline of Programme Indicates Subjects of Decided Interest Will Be Discussed.

Road builders of all states will gather at Detroit, Sept. 29, for the third annual American road congress. The first congress was held at Richmond, Va., in November, 1911, the second at Atlantic City, N. J., October, 1912, the attendance at the former place being 1200, while that at the latter was 2000. Officials expect the largest assembly at Detroit that ever has been known.

The executive committee is preparing an elaborate programme and a number of distinguished road builders will speak upon leading topics. Col. E. A. Stevens, state highway commissioner of New Jersey, will describe the proper treatment of worn out or ravelled macadam road surfaces; Henry G. Shirley, state highway engineer of Maryland, will read a paper dealing with systematizing and simplifying the purchase of materials and equipment; State Highway Commissioner Wilson of Virginia will discuss the labor question as it affects road construction; State Highway Commissioner Hurst of Wisconsin will take up the structure of drains for highways, and State Highway Engineer Keller of Alabama will tell how to care for unsurfaced roads. John A. McIlhenny, president of the United States civil service commission, will speak on the merit system in road administration.

There will be model exhibits under the direction of the United States office of public roads of every style of street and road surfacing, approved types of highway bridges and culverts, from a reproduction of the Appian Way down to the present time.

MANY HANDS MAKE LIGHT WORK.

Five Thousand Michigan Men Rebuild 250 Miles of Road in One Day.

Five thousand Michigan men, from nearly every walk in life, recently set an example which might be followed by the whole United States, by building 250 miles of excellent automobile road in a single day. Mayors of cities and towns, state officials, millionaire lumbermen and mill men worked in the hot sun, hewing with picks and axes at the corduroy slabs, throwing stones, shovelling sand and gravel, leading plow horses or performing other of the innumerable duties which form part of the task of road building.

They effected what seemed an almost impossible feat in the big swamp in Pulaski township, Presque Isle county. Corduroy, which was laid a generation or more ago and which had long been the terror of motorists, was removed, or so completely covered with a foundation of stones and earth, gravelled on top, that it will never again jar those who ride over it. As a result of the day's work there is an unbroken line of gravelled highway from Bay City to Mackinaw City, a distance of 250 miles, the fulfillment of what had been a dream for months and in some cases, years.

With the success of its last two ventures fresh in mind, the Motor Dealers' Contest Association of New York City, has definitely decided to revive automobile racing on the Brighton Beach one-mile track, and the date for the coming meet has been set as Aug. 9.

MOTORING LAWS AND THEIR ENFORCEMENT.

International Travel Club Adopts Resolution Respecting Uniform Traffic Regulations---New York Supreme Court Holds Accident Provision Constitutional.

IT WOULD appear that the subject of uniform motoring laws is soon to receive the attention that its importance deserves. Several of the eastern states have appointed commissions to meet in conference in an effort to draft a motor law which shall be possible of enactment in all these states. And in addition it is noted that the International Travel Club, composed of recognized touring organizations in this country and Europe, has taken the matter up in earnest.

At a recent meeting of the club in New York City, a resolution was adopted appointing a committee to proceed at once to the preparation of a set of uniform traffic regulations which will be advocated by the club in an effort to standardize the regulations in the various cities with a view to securing uniformity through their adoption by all the larger municipalities in this country and abroad. Frederick H. Elliott, well known in motoring circles, has the following to say in reference to the movement:

> At present nearly every city has a different set of traffic rules, which the police try to enforce; but many of them are so obsolete and unenforceable that it would be far easier to educate the public, as well as drivers and operators of vehicles, if each city had a standard set of regulations. Much force is given to this suggestion in view of the constantly increasing use of motor trucks, which are now used in delivering merchandise very generally, thousands of such vehicles covering a wide radius, often passing through a score or more of towns and villages in one day.
>
> It is reasonable to assume that if uniform rules for the regulation of traffic prevailed in all of the larger cities, and so far as necessary were adopted in all of the suburban points, pedestrians and all drivers and operators of vehicles would, within a short time, become thoroughly familiar with them, and the danger of accident be eliminated, while the traffic officers would be relieved of a great amount of trouble, which they complain they now experience.

CALLAN LAW CONSTITUTIONAL.

Provision Regarding Giving Name and Address So Held by Court of Appeals.

The court of appeals in New York State recently handed down a decision affirming the constitutionality of the provision in the so-called Callan automobile law requiring the operator to stop and give his name and address to the injured party or to the police in case of accident. The decision reverses that of the lower courts.

The case was that of the people against Edward T. Rosenheimer, who was indicted in 1910, and subsequently was arrested in Texas. His attorney demurred to the indictment on the ground that the provision was unconstitutional in that it compelled a man to give evidence which might tend to incriminate himself. In writing the decision Judge Cullen said in part:

> Physicians are required to report deaths and their causes, druggists the sale of poisons. The legislature might probably prohibit altogether the use of motor vehicles upon the highways or streets of the state. Then, why may it not equally be declared a crime to so use a vehicle as to injure any one in person or property? It is not declared a crime to operate an automobile on the highway even if it cause injury; but only failure of the operator causing the injury to identify himself. If the legislature can prohibit the use of automobiles it can certainly prescribe the conditions of such operation.
>
> I think it involves no violation of public policy or the principles of personal liberty to enact that as a condition of operating such a machine the operator must waive his constitutional privilege and tell who he is to the party who has been injured or to the police authorities—if, indeed, requiring him to give such information is an impairment of his constitutional privilege, which we do not decide.

WISCONSIN'S NEW LAW.

Section Providing Penalty for Reckless Driving Wins General Approval.

The new motoring law in Wisconsin has eliminated the maximum speed for automobile travel in the crowded business sections, and provides that machines shall be driven at a rate to be governed by the amount of traffic in the highway. This effort to regulate automobile speeding by a penalty for reckless driving is meeting with general approval from the public and authorities. In commenting upon the new law recently, Judge George E. Page of the district court in Milwaukee said:

> It is hard for a patrolman to judge of the speed of a car in a crowded street and a case brought on such grounds might be difficult to prove. But when he charges the driver with recklessness and calls four or five bystanders as witnesses that the car was being driven too fast for safety, the case ought to be easily won.

MANY SPEED TRAPS.

New York Resumes Ancient Practise but Legality Is Open to Question.

Within the past few weeks a large number of speed traps have been established in all sections of New York State. It is contended that the

Digitized by Google

practise has been revived under the provisions of the new law recently enacted, which permits local speed regulations under certain conditions, among which is the following:

And on further condition that each city or village shall have placed conspicuously on each main public highway where the city or village line crosses the same and on every main highway where the rate of speed changes, signs of sufficient size to be easily readable by a person using the highway, bearing the words, "City of ———" or "Incorporated village of ———." Slow down to "——— miles," (the rate being inserted) and also an arrow pointing in the direction where the speed is to be reduced or changed.

In view of this provision, the legality of the present procedure is severely questioned, inasmuch as the speed traps are being operated without the posting of the signs mentioned. Obviously, motorists passing from town to town are not familiar with the various ordinances, and many claim to have been arrested without being aware that they were exceeding a legal speed limit.

LEGISLATIVE BRIEFS.

Alderman Paul Miller of Bridgeport, Conn., has introduced an ordinance prohibiting the use of headlights on automobiles in the centre of the city and on streets which are well lighted.

A new law in effect in Massachusetts carries a provision for a fine of $60 or imprisonment for not more than 30 days for willfully throwing or dropping glass in a public street or highway.

The state auditor in Mississippi has been flooded with requests for the return of money paid for automobile registration since the supreme court declared the law passed in 1911 was unconstitutional.

It is understood that the Massachusetts highway commission has promised to take up the matter of eliminating the red rear lights on automobiles, following the example set by the Vermont legislature, with the idea of recommending the passage of a similar law in that commonwealth at the next session of the legislature.

Governor Sulzer of New York has appointed Samuel Walter Taylor of New York City, Fay C. Parsons of Cortland and Arthur A. Deer of Hornell, as members of the commission to serve with commissioners of various nearby states with a view to drafting uniform automobile laws.

The first instance in which a Massachusetts motorist has served a sentence in jail for driving while under the influence of liquor was recorded in Plymouth county early in the month. It was the second case in which the defendant was sentenced to jail, but in the other instance an appeal was taken.

Although the supreme court of Mississippi has found that the law requiring automobile registrations in that state is unconstitutional, the supreme court in the neighboring state of Alabama holds that the law in that commonwealth is valid. The case was that of the state against R. H. Bozeman, and the decision was handed down July 1.

Basing their action upon the wording of the state motoring law, certain Iowa cities are contemplating the enactment of ordinances limiting the rate of speed to two miles in six minutes. The law reads as follows:

"Such speed limitations not to be in any case less than one mile in six minutes." It is contended that the word "less" refers to miles and not minutes.

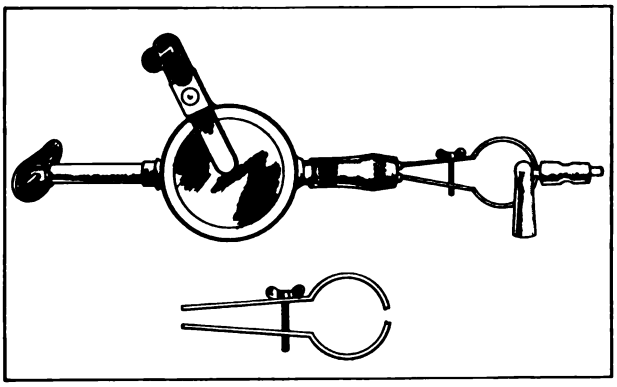
J-M FYRO IN ACTION.

How Fires on Racing Cars Were Extinguished at Indianapolis Motor Speedway.

One of the most exciting incidents of the 500-mile sweepstake race at Indianapolis, Memorial Day, was the spectacular finish of Charles Merz in a Stutz car, in third place, which made practically the last two laps on fire. And almost as spectacular was the remarkable manner in which the blaze was extinguished by the prompt use of a number of small but highly efficient hand extinguishers of a comparatively new type. It was the work of a few seconds for the pitmen to put out the blaze.

In addition to its use in the Stutz machine this extinguisher saved a Mason special, which slowed up in front of one of the pits with the under part ablaze. And the same apparatus also put out a fire on Burman's car, the Keeton, on the back turn. This remarkable little fire fighter is known as the J-M Fyro extinguisher and is held to be entirely different from every other extinguisher on the market.

There are no screws or nuts to adjust and no pumping is necessary. A simple twist of the wrist turns a wheel and the J-M Fyro does the rest. The fluid used in the device is a liquid gas, which is said to possess extraordinary extinguishing powers, and to be one of the few fluids which can be successfully used on gasoline fires. It contains nothing to corrode metal and cannot injure the most delicate fabric. When carried as part of the equipment of a car the J-M Fyro is attached to the running board or any convenient place by means of metal straps, which release at a touch, making the extinguisher instantly available in any emergency. The maker, the H. W. Johns-Manville Company, New York City, has recently printed some interesting literature on this subject, which it will be pleased to forward to anyone interested.



The Pierce-Arrow Motor Car Company, Buffalo, N. Y., maker of Pierce-Arrow cars, with characteristic progressiveness and enterprise, has adopted as standard equipment the Sager protection bumper, made by the J. H. Sager Company, 271 South avenue, Rochester, N. Y. To attach one of these bumpers to every Pierce-Arrow machine is a high tribute to Sager quality, but the bumper has merited distinction. Only the highest grade of material, including Shelby seamless tubing, is used in the Pierce-Arrow bumper, which is of the original and exclusive Sager bell crank type.

THE REPAIR SHOP AND THE GARAGE.

Suggestions for Bending Large Steel and Brass Tubing Without Kinking--Grinding in Petcock Valves with Breast Drill.

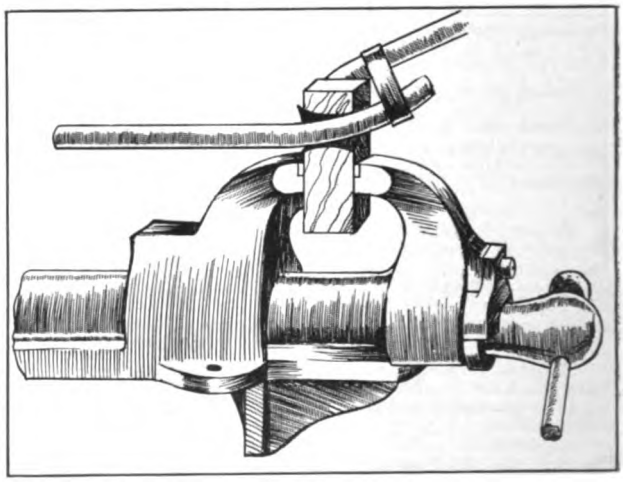
IN THE overhaul of a car it is possible that a new exhaust pipe may be needed because of the old member having been damaged or rusted

Device for Grinding in Petcocks with a Breast Drill.

out. While copper or brass pipes, especially if annealed, are bent easily, the shaping of steel or larger tubes is more difficult. In fitting a new exhaust pipe it is desirable to eliminate kinks, which are not only unsightly, but obstruct the flow of the gases. Copper pipes up to 1.5 inches may be bent cold if suitable blocks and levers are utilized, but steel tubes generally require heating and are more troublesome to handle.

A method of bending is shown in an accompanying illustration, from which it will be seen that the pipe is passed through the hole in the block, while the copper loop forms a fulcrum for the lever. The leverage obtained enables short bends to be made without kinking, and is secured by gradually moving the block, so that the pressure is not exerted continually at any one particular point during the operation.

Before commencing to bend the pipe, a wire templet of the shape required should be made. If the tube be of copper it should be filled with resin, run in while hot and allowed to cool. Three articles are required, as will be noted in the drawing; first, a hard wood block with a hole slightly larger than the diameter of the pipe; second, a loop made from an old piece of copper pipe, and third, a stout pinchbar of convenient length.



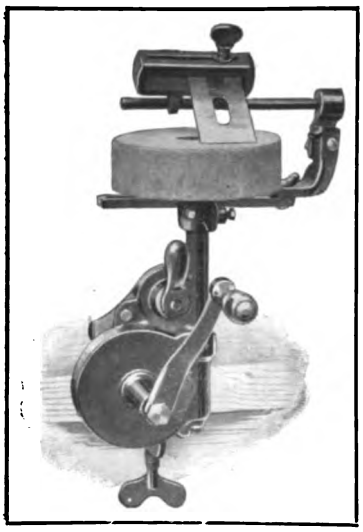
In bending steel tubing the same process is utilized, but the pipe is filled with sand, and the block should be of metal. The pipe is heated at the point at which the bend is desired, and is cooled off slightly on the side which forms an inner radius of the circle, to prevent kinking. A small hole should be drilled in the pipe in any convenient position to allow for the expansion of the sand when heated. Otherwise the contents are likely to be blown out during the bending process. Before fitting the pipe to the part it should be tested and inspected for flaws.

GRINDING IN PETCOCKS.

Sometimes petcocks in the fuel line leak unless the valve portion is driven in its seat. This will generally prevent leakage, but makes it difficult to utilize the petcock, which often becomes frozen, resulting in damage when moving the lever.

While grinding in the valve will usually cure the trouble, considerable time is required when the work is performed by hand. In an accompanying illustration is presented a suggestion for using a breast drill and facilitating the work.

The materials are not expensive and comprise two pieces of sheet steel about five inches by .75 by .125. The ends of these are shaped to fit the chuck of the drill as shown. When being ground in the valve plug of the petcock is retained in the auxiliary jaws by a thumb screw, which clamps the part securely. By rotating the



Suggestion for Bending Copper and Steel Pipes of Large Diameter Without Kinking.

handle of the breast drill the valve member may be ground in easily. The direction of rotation should be reversed from time to time.

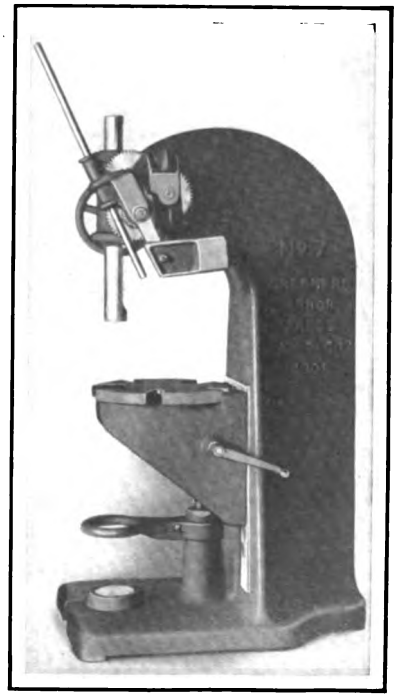
NEW TOOL EQUIPMENT AND MACHINERY.

ARBOR presses may be employed for a number of purposes in the repair shop, such as straightening rear axles, for example. Edwin E. Bartlett, 330 A street, Boston, manufactures a wide variety of Greenerd arbor presses and in an accompanying illustration is shown the No. 7, one of the largest types produced by the concern.

Luther Grinder Attachment.

It takes a diameter of 36 inches and has a leverage of 250:1, and a pressure of 25 tons is obtained easily. No change in principle or design has been made from the well known No. 5 Greenerd machine except in size and capacity. When the lever is in the position indicated in the illustration, the rack or ram may easily be moved up or down by means of the hand wheel.

The knee is operated by the crank shown, revolving a screw through a pair of miter gears. This screw runs in a nut in the base. The design is such that the knee can be lowered to its extreme position without the screw reaching the floor, making it possible to place the press in any position without cutting the floor for the screw. The knee is held to the frame by two studs and nuts, the nuts being adjusted and locked so that the knee can be moved easily. The pitch of the elevating screw is such that these nuts do not require tightening to hold the knee under the heaviest of pressure.



The No. 15 Greenerd is especially adaptable to automobile repair shops and has advantages over the No. 3.5, 4 and 5 sizes in that the capacity is 36 inches between the uprights and the opening under the revolving plate is 10 inches. One man can obtain seven tons, while two can secure 10 tons pressure. The maker is issuing a circular on arbor presses, which will be mailed upon request.

LUTHER HONING ATTACHMENT.

The Luther Grinding Manufacturing Company, Milwaukee, Wis., is marketing a new plane bit and chisel honing attachment for its machines of the Best Maide type. The parts to be sharpened, etc., are held rigidly in a clamp, which is moved back and forth across the face of the wheel, insuring a perfect angle and a smooth edge. The wheel is run in a horizontal plane. The Best Maide types of machines have a double grit wheel, the face side of the wheel on which the hone runs being extra fine for finishing purposes. This same attachment can be utilized on the round face of the wheel and the machine clamped into a horizontal position, as shown in the illustration.

ACKLIN BREATHER-OILER.

Some types of old motors are not fitted with breathers to relieve pressure in the crankcase, which results in a loss of lubricant. The Acklin Stamping Company, Toledo, O., is manufacturing a combination oiler and breather, the main body of which is of No. 16 gauge sheet steel. The metal is drawn to a depth of five inches and the bottom is necked so that there is one inch diameter at the lower half of the shell, while the upper part is 2.5 inches in diameter. A bead is thrown up around the bottom, and the flange is permanently secured in position by it and by the metal in the end of the shell being expanded back against it on the other side, making a rugged joint.

Bartlett Greenerd Arbor Press.

The cap is constructed of a lighter steel and is held on the breather by means of a bead which fits over a similar member on the main piece. There are openings in both the cap and the breather and these members may be adjusted as desired. The cap is easily removable.

IN THE REALM OF THE MOTORCYCLISTS.

F. A. M. Convention Opens in Denver---Many Join Annual Tour of Kansas Short Grass Club---Plans for International Touring Contests---Other News.

MANY amendments to the constitution will come before the Denver convention of the Federation of American Motorcyclists, which opened July 23 for three days. President B. J. Patterson is a candidate for re-election, but is being opposed by Dr. J. P. Thornley, chairman of the competition committee, who would like to see the office abolished and a different form of government introduced. He will bring in a resolution embodying his ideas. Various reports of officials will be considered and most of the progressive legislation is expected to be introduced by J. Leo Sauer, chairman of the legal action committee, who recently completed a tour of the country in the interest of the organization and whose word will carry much weight.

Louis B. Scully, Pawtucket, R. I., and His Merkel.

R. S. Morton, New York state commissioner, proposes that the president be nominated and elected by a general mail vote, thus giving every member a direct voice in the organization's affairs. He has also brought forward an amendment to break up the exclusive board of directors system of government and asks for a change which will enable general members of the federation to sit upon various committees which at present are inside the national directorate.

The delegates will be informed by Secretary-Treasurer G. B. Gibson that the total receipts for the past year, ending June 30, were $28,613.85, with an actual balance in the treasury on that date of about $3000. It will be learned that the restrictive agreement sanction receipts for the year were $2925 and the receipts for general sanction fees were $6919. The total expenses of Chairman Thornley's competition committee were $3894; Estabrook's membership committee, $2835.61, while President Patterson's expenses were $1015.74. Secretary-Treasurer Gibson paid out $9386 during the year. The meetings of the board of directors cost $1041.34, and legal action expenses were $569.70. The tour of the United States made by J. Leo Sauer cost $787.85, and the state commissioners spent $515.66 during the year.

Aside from the business of the convention the recreation side will be well taken care of, the Colorado Motorcycle Club having arranged an elaborate programme. The club rooms are thrown open to the visitors and adjoining is a motorcycle garage, where members' machines will be taken care of for 15 cents a day.

An official programme outlining the various beautiful trips to be found in and around Denver is furnished the tourists upon their arrival and the scenery is unsurpassed. Among the places to be reached from Denver are Yankee Doodle lake, James' peak, Rollins' pass, where snow is deep in midsummer; Great Continental Divide, Frazer canyon, Sphinxhead rock, Mt. Morrison, famous Rock of Cries in the Park of Red Rocks, Thumb rock, Ladder cave, Cave of Saturn, Slabs of the Ages, Garden of Titans, Garden of the Gods, Manitou park, Pike's peak and the mining region.

Kansas Short Grass Tour.

About 500 motorcycle riders left Hutchinson, Kan., July 14, for the annual tour, held under the direction of the Kansas Short Grass Motorcycle Club. Among the riders were visitors from all parts of the country, the chief disappointment being the inability of Elbert Hubbard of Aurora, N. Y., to take part, it having previously been announced that he would be present. Riders who started were from Kansas, New England, Indiana, Nebraska and the South.

Another disappointment was the lack of women riders, arrangements having been made for a separate division of women motorcyclists in anticipation of a large delegation, which was to be led by Miss Inez Patterson as captain. She is the daughter of Dr. B. J. Patterson of Hutchinson, president of the F. A. M., who led the tour. But one woman rider appeared, save Miss Patterson herself, and these two made the tour with the main party.

Three divisions of the tour started on July 12

Chart Showing Increase in Shipment of Bosch Motorcycle Magnetos.

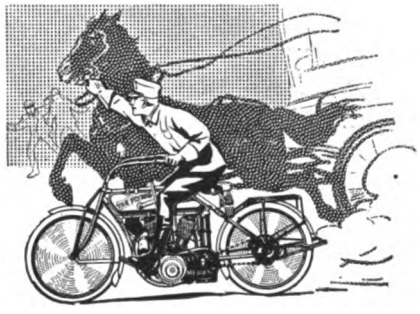
at Wichita, Emporia and Salina, Kan., converging at Hutchinson, where the entire party took up the journey to Denver, Col., the total distance being 572 miles. The itinerary included Hutchinson, Larned and Dodge City, Kan.; Holly, Las Animas, Pueblo, Canon City, Colorado Springs and Denver, Col. At Dodge City races were held and all along the route the principal points of interest were visited. Altogether it was the most successful tour in the history of the Kansas Short Grass Club. The party arrived at Denver, July 22, the day before the opening of the national convention of the F. A. M.

Bosch Production Record.

The fiscal year of the Bosch Magneto Company, New York City, maker of Bosch ignition equipment, ended July 1, and a record of its shipments of motorcycle magnetos is of interest as having a bearing upon the growth of the industry. An accompanying chart shows in a graphic manner the increase in this department of the company's business, which has been over 171 per cent. for the year of 1912-1913. During the period named approximately 103,000 motorcycle magnetos left the factory in Springfield, Mass., the facilities of which are such that it would have been able to take care of a much greater output had this been necessary.

On the Transcontinental Journey.

Mr. and Mrs. LeRoy Snodgrass of Los Angeles, Cal., have passed Albuquerque, N. M., on their overland journey to New York City on their Henderson motorcycle and sidecar. They left Long Beach, Cal., May 25, and expect to arrive in New York about Sept. 15. They crossed the Mojave desert over a terrible trail of 300 miles and after arriving at the Grand Canyon they proceeded by way of Flagstaff, Magdalena and Socorro, to Albuquerque. Mr. and Mrs. Snodgrass, the motorcycle, sidecar and total equipment weigh 1120 pounds. The outfit includes a tent, cooking outfit, shovels and other tools.



Merkel Restored His Health.

About a year ago Louis B. Scully of Pawtucket, R. I., found his health such that it was deemed advisable to visit the Southwest. Mr. Scully immediately decided to make the trip on his 1913 Merkel, made by the Miami Cycle & Manufacturing Company, Middletown, O. He covered a large portion of Oklahoma, Arizona, New Mexico and Texas, and returned to New England completely recovered. An accompanying illustration shows him riding the Merkel in Pawluska, Okla.

International Touring Trial.

The first international touring trial for teams of three motorcycles, nominated by any organization belonging to the Federation Internationale des Clubs Motocyclistes, to be run in conjunction with the 1913 six days' open reliability trial promoted by the Auto-Cycle Union, will be held at Carlisle, Cumberland, England, Aug. 18-23. The Manufacturers' Union of Great Britain has purchased a large cup, said to be worth $1000, as a perpetual trophy for the event.

Four countries, not including the United States, already have signified their intention of entering teams. The six days' trials will be for

ALWAYS READY FOR ANY EMERGENCY!

With its ability to pick up speed quickly—(60 miles an hour from a standing start within a city block)—the 1913 Flying Merkel Motorcycle is always ready for instantaneous use. These features and the fact that the Flying Merkel Motorcycle is the most economical in the world to operate has led to its universal adoption by Police Departments, Park Boards, Gas Companies, Telephone and Electric Light Companies and all other business concerns and individuals whose requirements demand a sturdy, reliable motorcycle at the minimum cost of upkeep. Remember, the Flying Merkel

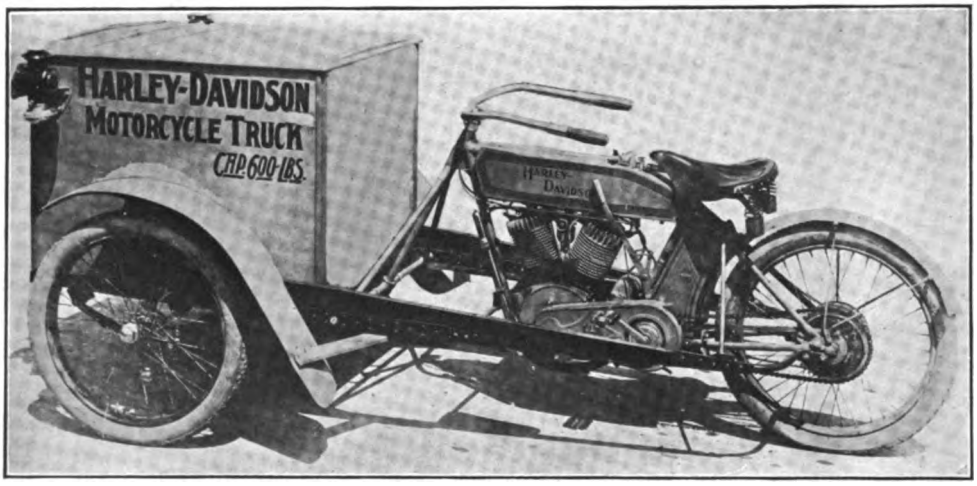
Digitized by Google



motorcycles, motorcycles with sidecars and cyclecars, the actual trials occupying five days and the sixth being given over to technical examination of competing machines.

Stolen Merkel Machine.

Charles E. Carter, chief of police in Columbus, O., announces that a Flying Merkel motorcycle, owned by Connie Yoest, was stolen from the shed in the rear of his residence at 1546 East Fourth avenue, in that city, on the night of July 7. The machine was a yellow frame, twin-cylinder 1913 model, No. 8895, rated at seven horsepower, chain driven, with tandem seat and large Solar lamp, and bearing a Columbus license tag No. 153.

French Grand Prix.

Big fields ruled in the second day's programme of motorcycle races at Amiens, France, in connection with the French Grand Prix automobile race. There were 13 contestants in the race for 350 cc machines over a course of 218 miles. A Clement-Bayard of France finished first in 4:00:27. A Rudge, an English make, won the race for 500 cc machines, in which there were 34 starters. The time was 4:22:00.

Harley-Davidson Parcel Post Car, Which Is Termed by the Maker a Motorcycle Truck of 600 Pounds Capacity.

An interesting event was that for sidecars, in which the racers carried passengers. In all but one instance mechanics accompanied the riders, the one exception being a woman passenger. Morgan was the winner over a field of 20 in 3:53:00.

New Affiliated Clubs.

New clubs that have affiliated with the F. A. M. are as follows: Wheeling, Wheeling, W. Va., 29 members; secretary, H. L. Cotton. Billings, Billings, Mont., 17 members; secretary, Gerald R. Simpson. Sioux Falls, Sioux Falls, S. D., 13 members; secretary, S. L. Strommerson. Monessen, Monessen, Penn., 18 members; secretary, M. Layman. Findlay, Findlay, O., 25 members; secretary, F. W. Day. Haverhill, Haverhill, Mass., 36 members; secretary, E. P. Tappan. Warpath, Springfield, Mass., 20 members; secretary, H. O. Rogers. Troy Indian, Troy, O., 20 members; secretary, C. H. Folker. New London, New London, Conn., 16 members; secretary, N. L. Cone.

Harley-Davidson Delivery Car.

The Harley-Davidson Motor Company, Milwaukee, Wis., is calling special attention to the Harley-Davidson delivery car, an illustration of which is presented herewith. The machine is the result of experimentation which was begun some three years ago, when Mr. Harley became convinced that the solution of the light delivery problem rested in a vehicle driving through a single rear wheel and propelling the load supported between two fore wheels.

The vehicle is designed to carry 600 pounds in addition to the driver. The tread is standard, 56 inches, and the wheelbase 76 inches. Several body types are produced, but the standard body shown is two feet 10 inches wide, three feet six inches long and two feet four inches high, with the doors opening in front. The machine is equipped with the Harley-Davidson two-speed gear, which gives a ratio of 5:1 on the high and 10:1 on low speeds.

Experience with these machines indicates that it is possible for one man to do the work of two horses and two wagons. They make from 40 to 45 miles to the gallon of gasoline. Their economy and efficiency have been called to the attention of the United States government, and at the request of the postoffice officials one has been sent to Washington for inspection by the postal department. That particular machine has a body built in accordance with the suggestions of postal authorities.

Seeking Space at Shows.

The first application for space at the Chicago motorcycle, bicycle and accessory show, to be held at the Chicago Coliseum and Annex, Nov.

Digitized by Google

3-8, was received from Peter A. Frasse Company, New York City, importer of Renold chains and other accessories. The second application was from Van Cleef Bros., Chicago, cement maker and jobber of motorcycle and bicycle sundries. This firm also wants space at the New York show. Any manufacturer or jobber desiring to exhibit and who does not receive application blanks, which are now in the hands of the printer, can secure them by communicating with A. B. Coffman, 942 Nicholas building, Toledo, O.

An Indian Night Rider.

Willis Nelson of Waltham, Mass., believes the evening hours are the best time of the day in which to reap the greatest benefit from his Indian. Nelson is a baker by trade, and usually starts out at 5:45 in the afternoon for his rides. He thinks nothing of covering 70 or 80 miles during an evening, and the feature which most directly appeals to his friends is that he is at all times ready to help those who become stranded on the road for any reason.

Mr. and Mrs. Gale at Denver.

M. E. Gale, Angola, N. Y., connected with the Emblem Manufacturing Company, Angola, accompanied by Mrs. Gale, who occupied the Gale side seat attachment, attended the convention at Denver of the F. A. M., riding from Angola to the Colorado city. After the convention they intend to return home by the same method. Mr. and Mrs. Gale have made a notable reputation for long distance touring by motorcycle.

To Build Its Own Motors.

It is announced that the Davis Sewing Machine Company, Dayton, O., maker of Dayton motorcycles, will build its own motors for its 1914 machines. The patterns are already being made and the contract has been let for the cylinder castings.

Club Notes, Here and There.

The South Side Motorcycle Club and the St. Louis Motorcycle Club, St. Louis, Mo., have consolidated and the club will in future be known as the Motorcycle Club of St. Louis. The membership is at present about 200 and a campaign will be started to increase this number. The following officers have been elected: President, P. Kennett; vice president, Mr. Newman; secretary, R. E. Winkler; treasurer, Mr. Peach; captain, H. Steele; lieutenant, H. Collins.

The Fort Wayne Motorcycle Club, Fort Wayne, Ind., recently celebrated its first anniversary with over 100 active members. The club has incorporated under the Indiana laws and is equipped with every modern convenience.

Members of the Worcester Motorcycle Club, Worcester, Mass., enjoyed a recent outing to Nantasket beach. They rode to Boston, where they garaged their machines, going to Nantasket by boat. The club has another membership contest in progress and next month a banquet will end the contest.

The third quarterly endurance run of the Cleveland Motorcycle Club, Cleveland, O., was held under perfect weather conditions. Erie, Penn., was the turning point, making a trip of 203 miles. More than 20 machines started and ideal roads turned the affair into a pleasure jaunt which resulted in 17 perfect scores.

The Appleton Motorcycle Club, Appleton, Wis., recently held a tour of three days through Wisconsin, the event being promoted by Wettengell & Wettengell, local agent for Harley-Davidson machines. There were 45 riders in the tour, Harley-Davidson, Thor, Excelsior and Indian machines being represented. It is planned to hold another run the latter part of August.

Willis Nelson, Waltham, Mass., and His Indian Mount.

The Rockford Motorcycle Club, Rockford, Ill., has devised a new system of aiding members who are injured while riding, having established what is known as a Red Cross fund. The monthly dues are $1 and in future 25 cents of each member's dues will be set aside in the Red Cross fund. Any member injured while riding may draw on the fund to an amount not exceeding $25 for physician and hospital bills.

The Maryland Motorcycle Club, Baltimore, recently held its annual outing and crab feast on the shores of Middle river. Athletic events enlivened the outing.

NEWS OF THE MANUFACTURER AND DEALER.

The following concerns have been incorporated recently to manufacture or deal in automobiles, accessories, etc.:

Modern Motor Car Company, Bowling Green, O.; $1000; W. P. Albey, Dale I. Ladd, R. E. Ladd, J. A. Walker, T. E. Moore.

Huffman Manufacturing Company, Youngstown, O.; $10,000; tire protectors for motor trucks, E. S. Walton, W. B. Hall, H. H. Stambaugh, Richard Garlick, John T. Harrington.

Pneumatic Gear Shift Company, Chicago; $25,000; George W. Killalea, E. O. Leowen, D. Krinsky.

Overland-Garford Sales Company, Cleveland, O.; $10,000; Malcolm Bridgman, Royal R. Scott, George F. Russell, Herbert O. Fitch, Charles M. Ackerman.

Dayton-Buick Company, Dayton, O.; $10,000; L. J. Haughey, Charles Abel, Joseph A. McKenny, Earl Simon, A. J. Smith.

Auto Drive & Parts Company, Indianapolis, Ind.; $100,000; John J. Kennedy, John J. Kelly, L. D. Buenting.

Auto Maintenance Company, Newark, N. J.; $10,000; Bernard A. Kelly, Catherine Kelly, John E. Anderson.

Uhrlandt Gas Generator Manufacturing Company, Columbus, O.; $100,000; Daniel N. Hyman, Oswell C. Phillips, Harry D. Shepard, Arthur Uhrlandt, Samuel Esswein.

New Building of George A. Haws, Maker of Panhard Oils, at 142-144 Front Street, New York City.

Standard Purchasing Company, Inc., New York City; $10,000; Harry L. Cook, Harry F. Dexter, William H. Brooks.

Bremen Garage Company, Bremen, O.; $10,000; Albert E. Godfreyn, Edward A. Hufford, Arthur D. Hufford, Howard D. McCandlish, Milton L. Campfield.

Dallas Automobile Association, Dallas, Tex.; $5000; S. H. Breen, A. V. Lane, P. H. Keene.

Orleans Motor Company, Beaumont, Tex.; $7500; C. L. Smith, J. K. Smith, S. F. McMcConnico.

Eagle Manufacturing Company, Fort Wayne, Ind.; $50,000; automobile plows and machinery; H. F. Schnelker, W. J. Barth, Frederick Krejbaum, F. Green, Charles B. Orff.

Merchants Garage, Indianapolis, Ind.; $15,000; C. S. Shotwell, M. J. McGarr, H. H. Rice, W. A. Atkins, B. D. Christian, C. W. Dicks, C. B. Marshall.

G. B. Sales Corporation, New York City; $5000; Edward E. Reardon, Francis J. O'Grady, Irving C. W. Williams.

Consolidated Garage Company, San Jose, Cal.; $100,000; L. W. Bush and others.

D. & R. Storage Battery Company, Inc., Brooklyn, N. Y.; $100,000; A. F. Lucker, J. E. Reid, R. Drambourgh.

Findeisen & Kropf Manufacturing Company, New York City; $5000; F. Findeisen, O. F. Kropf, Charles A. Reigelman.

Demos Auto Repair & Garage Company, New York City; $3000; Demos Tsaconas, James E. Bradley, Gustave A. Gsell.

College Avenue Garage, Indianapolis, Ind.; $2000; F. H. Rupert, M. Rupert, H. A. Davis.

Murchison Garage & Machine Company, Benson, N. C.; $25,000; Alonzo Parrish and others.

Greensburg Transportation Company, Grensburg, S. C.; $10,000; George Rundle, C. R. Baker, T. D. Baldwin.

Williams Automobile Transmission Company, Nashville, Tenn.; $100,000; P. H. Cain, H. H. Campbell, Thomas L. Herbert, Benjamin S. Williams.

Turin Garage & Supply Company, New York City; $5000; Anna Grabschield, John F. O'Neil, Frank H. Coyne.

WITH THE MANUFACTURERS.

George A. Haws, New York City, founded the oil firm bearing his name in 1875, and since his death in 1888, the business has been conducted as a co-partnership without change of designation. From the first it has specialized in products of Pennsylvania crude, and when automobiles first began to be a factor of any real importance, this firm realized that thin, highly filtered oils of good viscosity would give better results than the very heavy steam cylinder stocks originally used. When Panhard oil first was placed in the market most automobile experts were skeptical, believing that it could not have sufficient body to lubricate. But as one after another was induced to try it, the conversions were speedy and permanent. Recently it was found necessary to erect a new building at 142-144 Front street, and this is the fifth or sixth which the firm has occupied, each succeeding one being larger than it predecessor; the result of the demands of a constantly growing business in the face of ever increasing competition. The latest structure, which is shown in an accompanying illustration, will be used for offices, packing, shipping and storing of stock. It is equipped with an up-to-date system of piping and pumps, which makes for an easier and speedier handling of the oil; can filling machinery and compounding vats. The managing partner of the firm is M. J. Martin, whose special care is for the mill and factory trade in general lubricating oils and greases of all kinds, while the automobile trade is in charge of Henry E. Haws.

The Keeton Motor Company, Detroit, maker of Keeton cars, has started work on the first of a series of additions to its plant. The first structure will be 100 feet in length, 60 feet in width and one story in height, of modern factory construction. It will be used for a testing plant. Others will be located on the present property of the company, while a still larger building than the present plant is contemplated on land lying between the Keeton factory and the Michigan Central railroad tracks.

The United States Tire Company has broken ground in Baum boulevard, Pittsburg, Penn., for a new service station for its solid motor tire department. A two-story and basement brick building will be erected. The company occupied its present building in October, 1911, and since then the business has grown to such volume that the new structure required will be the largest building devoted to the rubber tire trade in Pittsburg.

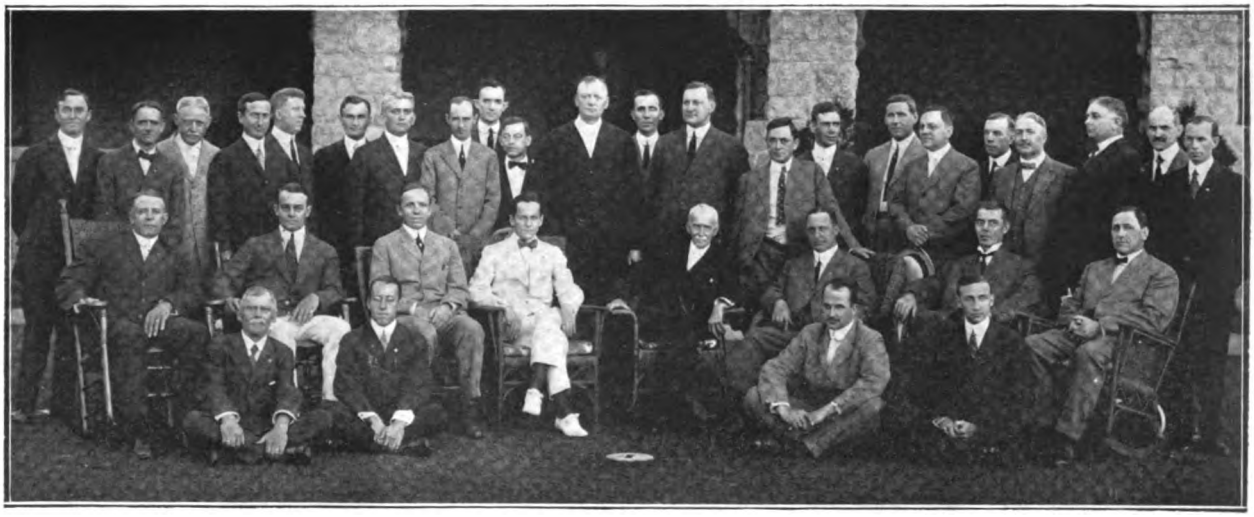
The Hexter Motor Truck Company of New York, which several months ago was acquired by John N. Willys, president of the Willys-Overland Company, Toledo, O., and several subsidiary concerns, has been legally authorized to change its name to the Willys Service Corporation. The change wil become effective Aug. 11.

The Willard Storage Battery Company, Cleveland, O., maker of Willard storage batteries, has established a new branch office at 438-439 Indiana Pythian building, Indianapolis, Ind.

E. J. Moon, president of the Moon Motor Car Company, St. Louis, Mo., maker of Moon cars, recently visited the principal Moon agencies in the West, his trip lasting five weeks. Among the cities visited were San Francisco, Los Angeles, Seattle, Ogden, Salt Lake City and Denver.

Fred J. Wagner, recently elected vice president of the

Digitized by Google



Ajax-Grieb Rubber Company, New York City, maker of Ajax tires, has completely recovered from an operation, following which he entered upon a western trip in the interests of his firm.

J. E. Kirchner has become chief engineer of the Mogul Motor Truck Company, St. Louis, Mo., maker of Mogul trucks. The company recently moved from Chicago and in securing Mr. Kirchner it obtained an automobile engineer of recognized ability.

L. A. Austin, 210 Medbury avenue, Detroit, has resigned as general manager of the Mais Motor Truck Company, Indianapolis, Ind., maker of Mais trucks. Mr. Austin is entertaining several offers, none of which he states he can accept until later in the year.

H. H. Robinson, southern travelling representative of sales department of the Keeton Motor Company, Detroit, recently visited the factory and shipped a Keeton touring car from Detroit to Newport News, Va., from which point he toured the South along the coast of Miami, Fla., visiting all the large cities. Mr. Robinson has covered much of his territory in a Keeton car this year.

The Republic Rubber Company, Youngstown, O., maker of Republic tires, recently held a convention of branch managers, officials and department heads at the factory, during which the present sales situation and future prospects were discussed at length. An accompanying illustration presents the members of the party, which included the following: President T. L. Robinson, Vice President L. T. Peterson, General Sales Manager J. H. Kelly, Superintendent A. H. Harris, Assistant Superintendent W. D. Harris, Secretary C. F. Garrison, Treasurer M. I. Arms, Second Assistant Sales Manager H. W. Bixler, Advertising Manager Web Brown, Purchasing Agent N. W. Sayles, Auditor G. L. Stansbury, Manager O. M. Norby of the credit department, Manager E. N. Frase of the hose department, Manager Thomas Matchett of the belting department, Engineer C. E. Rice, Paymaster W. Dunn, Shipping Clerk W. D. Norris, T. J. Mell, inventor of the Staggard tread, and the following branch representatives: H. K. Wick and John C. Wick, Youngstown, O.; M. E. Murray, San Francisco; C. W. Hardin, New York City; J. W. Maguire, Chicago; W. S. Carleton, Boston; B. C. Swinehart, Philadelphia; J. C. Kearne, Detroit; B. F. Morris, Buffalo; G. A. Sohl, Atlanta; J. Palmer, Chicago; F. G. Hill and H. W. Pratt, New York; F. W. Osmun, Minneapolis; G. M. Hoffman, St. Louis; G. N. Talcott, Cleveland.

Officials, Branch Managers and Department Heads at Recent Convention of the Republic Rubber Company's Factory in Youngstown, O.

GARAGE AND DEALER.

Harry M. Bronner, formerly manager of the Stoddard Dayton Company, and later of the Edwards Motor Car Company, New York City, who has been president of the Automobile Dealers' Association in that city since the first of the year, has resigned from the association on account of his going out of the automobile industry. The vice president, Arthur M. Day, of the Elliott Ranney Company, was elected to fill the vacancy. C. H. Larson of the Cutting-Larson Company, was chosen to the office of vice president. There being a vacancy on the board of directors caused by Mr. Bronner's resignation, R. H. Johnston of the White company was elected to that place.

The Chevrolet Motor Company has located salesrooms at 1651 Broadway, New York, and 1505 Bedford avenue, Brooklyn, N. Y. George H. Connor is in charge of the New York branch and Warren A. Suklon is manager of the Brooklyn office.

Edward Hayes and A. J. Diefenderfer, for a long time connected with the New York branch of the Lozier Motor Company, distributor of Lozier cars, have gone into the used car business. These men, who have been identified with the automobile business for the last 12 years, have opened headquarters at 19 West 62nd street.

John E. O'Neil, Lawrence, Mass., has incorporated his automobile business under the name of John E. O'Neil, Inc., with a capital stock of $1000.

R. F. Ketchum, formerly manager of the Mack Motor Truck Company of Boston, distributor of Mack trucks, made by the International Motor Company, New York City, has been appointed manager of the Boston branch of the R. & L. Company, distributor of Garford trucks, made by the Garford Company, Elyria, O. P. C. Chrysler, the former manager, has returned to the home office at New York City.

The Oakland Motor Company, New York City, has leased the third floor of the Postal Service Company's building, Broadway and 62nd street.

Cook, Williams & Wallace, Lakewood, N. J., is erecting an addition to its garage on Holly street.

The Peerless Motor Car Company, Philadelphia, Penn., has begun construction work on the erection of a new plant near Chestnut street.

The Standard Motor Car Company, Columbus, O., has been formed by H. J. Schwartz and Samuel J. Morris and salesrooms have been opened.

The Humes Auto Company, Tarentum, Penn., contemplates the erection of an addition to its building, which will be used as an office and accessory supply house.

L. R. Speare, formerly president of the American Automobile Association, has disposed of his interest in the W. L. Russell Company, Boston agent for Regal and Haynes cars, and Mr. Russell is now conducting the business alone.

A. C. Weaver, formerly manager of the Lozier Sales Company, Cleveland, O., has become general manager of the company. A. W. Woodruff, formerly manager, has become manager of the Lozier branch at Boston.

MILLER'S SPECIAL CATALOGUE.

Supplemental List of New Accessories Carried by the Pioneer Dealer.

Chas. E. Miller, 97-103 Reade street, New York City, pioneer dealer in automobile accessories, supplies and fittings, has issued a special catalogue No. 26, which is in the nature of a supplemental list of new things produced since the annual catalogue was compiled. The motorist who desires to keep abreast of the times in this regard will desire a copy, which may be had free upon request.

Each of the 14 Miller branch stores in New York City, Brooklyn, Buffalo and Albany, N. Y.; Boston and Springfield, Mass.; Hartford, Conn.; Detroit, Mich.; Cleveland, O.; Philadelphia, Penn.; Atlanta, Ga.; New Orleans, La., and Newark, N. J., carries a line as complete, insofar as selection is concerned, as is that of the main store.

The adoption of parcel post policy in its delivery system places the Miller service at the disposal of every motorist in the country, no matter where located.

NATIONAL IN FUEL TEST.

Trials on Three Consecutive Days in Indianapolis Show Average of 16.7 Miles.

A regular stock National car, made by the National Motor Vehicle Company, Indianapolis, Ind., taken from the salesroom of the National company, has been used by the Prest-O-Lite Company at Indianapolis in a series of tests to determine the mileage a gallon of gasoline. A speed of 25 miles an hour was maintained in these tests, which were made by disconnecting the main gasoline line, and attaching direct to the carburetor a special line and testing can, into which a measured gallon of gasoline had been poured.

On one day the National car made 16.9 miles on a gallon, the following day, 16.5 miles, and the third day, 16.7 miles. The slight difference is thought to have been due to wind resistance. This is considered by automobile authorities to be a very creditable showing for a heavy touring car, such as the National, which was used in the test.

AMERICAN CARS ON FOREIGN ROADS.

General Manager Nash States His Impression upon Return from Trip Abroad.

Because American cars are built for American roads and the latter are so much worse than European ways is the reason that automobile exports have shown such a remarkable increase during the 1913 season, according to C. W. Nash, general manager of the Buick Motor Company, Flint, Mich., maker of Buick machines. Mr. Nash has just returned to Flint after spending a month abroad with his family. He visited Queenstown, Cork and Dublin, in Ireland; Hollyhead, Chester, Coventry, Stratford and London, in England; and Paris and surrounding places of interest in France, as well as some of the principal cities in the adjacent countries of Europe.

Mr. Nash states that American cars are built to withstand hard road shocks, while the European roads, which have been in the course of perfection for centuries before America was even discovered, are very smooth. The foreign builders do not make their machines for such hard road work as do American makers, so that a machine made here to stand up for 10,000 miles will run on European roads for 20,000 and even as much as 25,000 miles.

EXPORTS AND IMPORTS.

Statistics Show Canada and Great Britain as America's Best Customers.

Although the exports of automobiles to Canada in May of this year were not so large as during the same month in 1912, that country continues to be the largest customer of American manufacturers. The British Kingdom is second and a gain is shown over the corresponding period last year. The total exports of motor cars shows a decided gain in foreign business over last year. Following are the detailed figures of imports and exports for the month, just made public by the bureau of foreign and domestic commerce of the Department of Commerce:

Imports.

	1912		1913	
Country	No.	Value	No.	Value
France	41	$95,965	17	$49,515
Germany	5	10,114	8	21,154
Italy	11	17,424	9	23,615
United Kingdom	11	28,324	3	6,300
Other countries	8	13,932	5	13,153
Totals	76	$165,759	42	$113,737

Exports.

France	63	$48,980	108	$72,149
Germany	49	36,719	192	145,799
Italy	30	35,605	5	12,500
United Kingdom	673	465,722	473	354,686
Other Europe	204	155,125	294	236,447
Canada	1109	1,352,856	862	1,255,771
Mexico	8	15,370	6	5,110
West Indies and Bermuda	29	36,237	45	47,591
South America	162	183,292	213	248,707
British Oceania	445	412,565	234	220,372
Asia and other Oceania	152	149,309	282	272,174
Other countries	85	72,038	322	283,883
Totals	3009	$2,963,818	3036	$3,155,189

ANNUAL SHAN KIVE.

Plans Maturing for Motorists' Carnival in the Garden of the Gods.

The Pike's Peak region in Colorado has been the mecca of a larger number of motorists this summer than ever before. It is estimated that over 500 outside machines went to Colorado Springs during the month of June, and nearly half the number took out permits to remain some time.

The Shan Kive, with bands of Ute Indians as the principal feature, is to be held this year Sept. 2-4. A thousand cars carried more than five times that number of people to the Garden of the Gods one day during the festival last fall to see the Utes dance amid the historic rocks. Oklahoma visitors have taken the prize two years in succession for the largest number of outside machines in the Shan Kive parade.

Among the plans this year is the staging of a pageant showing the history of the Pike's Peak region. No more picturesque spot for this can be found than the huge red rocks in the Garden of the Gods. A great camp will be organized, composed of Indians, cowboys, trappers and other representatives of early days. Here will be illustrated aboriginal life, the Spanish invasion, the early trappers, finding of gold and the attendant rush, Indian warfare, the cattle and sheep eras, agricultural progress and modern life.

MIDSUMMER MOTOR SHOW.

Cleveland to See New Fall Models Under Canvass in August.

The new fall models and latest improvements in automobiles will be displayed for the first time in Cleveland, O., at a midsummer motor show to be held the last week in August, simultaneously with the Forest City fair at North Randall. This is an entirely new plan and it is expected to meet with the approval of manufacturers and dealers.

Two of the largest tents in the country have been secured and pleasure cars, commercial vehicles, accessories, motor boats and motorcycles will be exhibited under canvass. Fred H. Caley, who has managed the annual automobile show in Cleveland for some years past, will be in charge.

Forrest M. Keeton, vice president and general manager of the Keeton Motor Company, Detroit, recently completed a run of 725 miles from Detroit to his old home in Southern Ohio and return, the trip being partially for pleasure and partially for experiment. During the long journey the six-cylinder Keeton car consumed 13.75 gallons of gasoline, or an average of 13.7 miles to the gallon. This is considered a remarkable feat for a six-cylinder car as large as the Keeton, which carried seven passengers. With the thermo-syphon system, which was given a thorough test, it was unneccesary at any point on the journey to replace water lost through evaporation or otherwise.

The Two Hundred Club, unique in the ranks of motoring bodies, has been formed by the contest committee of the Chicago Automobile Club. Any motorist who drives 200 miles in 10 hours without a motor stop and conforms to the rules of the test will be eligible to membership. Competition will be open to any motorist in the United States. As soon as 25 have qualified a permanent organization will be effected.

SPLITDORF

"Always There"

The SPLITDORF "TS" COIL is new and the best and most effective coil on the market today. You can have your car equipped with this new style SPLITDORF COIL to work in connection with the SPLITDORF MAGNETO on your car.
The "TS" is interchangeable with any type tube or dash coil and can be attached to any car. We will make you a very liberal allowance on your old coil in exchange for one of the new style.

You can also have your entire ignition system exchanged for the latest type SPLITDORF MAGNETO and COIL at an exceptionally attractive price.

"New ignition for old" is our slogan—we intend to install SPLITDORF IGNITION throughout our territory and, to aid us in doing so, we have a SPECIAL EXCHANGE PROPOSITION of great interest to every owner of a gasoline motor. Write TODAY for particulars.

40 Gallons Less

New York to Albany Race

With a Planhard

June 30, 1913.

Planhard Mfg. Co.—My engine on Excelsior is a home-made 2 cycle 3 cylinder 4¼x5 inch. The very best I ever did with the S———— carburetor was 580 R. P. M., and I am now making 625 under the same conditions with a Planhard. Two years ago in the New York to Albany race I used **105 gallons** of gasoline in 27 hours 57 minutes. This year I only used a trifle over **65 gallons.** I had to sell surplus gasoline at Edgewater for 18 cents that I paid 22 for in Albany, as I had no place to store it, so you see how it worked.

The race just completed was splendid, and I should have done better time had I followed the New York M. B. C. courses better, but I disobeyed its instructions and ran on a mud flat above Coxsackie. Coming back my timer broke when I was off Fishkill Landing and I limped home, making wooden plugs as fast as they wore away. However, with all delays the Planhard enabled me to beat my previous record **1 hour 45 minutes.** Thomas Trolsen.

Best Croxton Could Find

The Planhard Mfg. Co. May 20, 1913.

Gentlemen—We have decided to adopt the Planhard as "Croxton" carburetor equipment because we find it excels all others in economy, power, speed and most important of all in a pleasure car—flexibility. * * *

We determined to make the "Croxton" superior to any automobile in its class in every way, and only the best accessory of its kind, regardless of price enters into its makeup.

Realizing the importance of the carburetor as the most vital single factor in the operation of a car—especially now with the low and variable grades of gasoline commercially available, we determined that the "Croxton" should be the most modern, dependable and faultless, in this all important respect.

With this end in view, we laid out a series of heart-breaking tests for carburetors that would leave no doubt whatever as to the results of our decision. Your carburetor left all others at the post. * * *

We congratulate you on your possession, and wish you every success.

Very truly yours, THE CROXTON MOTOR CAR CO.,
J. P. Stoltz, President.

25 Miles to Gallon on Ford

North Fairfield, O., May 16, 1913.

Gentlemen—After taking the old carburetor off my Ford car and putting on a Planhard, I increased my mileage from **18 to 25 miles per gallon,** and my engine, which was a notorious heater, runs as cool as desirable for the best results. I am using 60 to 62 gasoline, and as I have a hydromoter, I know what I am talking about. A. W. Grandon.

Threaded? Flanged? Horizontal? Vertical?

Pat. Europe. Pat. America

Showing M&M Attached with ½" Elbow.

Try the M&M Economizer For Speed, Power and Economy

HOW ABOUT THIS LETTER!

Lewistown, Pa., July 23, 1913.

Moller Bros., Philadelphia, Pa.

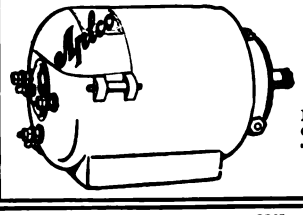
Gentlemen:—This is to advise you that the two M&M Economizers which I placed on my trucks, have met with my expectations, and I find them to do everything which you claim for them. They make a decided difference in the cars as to power, and economy on gasoline.

Yours very truly. ROBERT B. MONTGOMERY.

WHAT COULD BE MORE CONVINCING THAN THE ABOVE LETTER! ALSO, the M&M is guaranteed to do just what we claim, and if it proves unsatisfactory within thirty days, YOUR MONEY WILL BE REFUNDED. (Reference—Citizens National Bank, Lewistown, Pa.)

The M&M is guaranteed to save from 40 to 50% of gasoline, and increase the speed and power 20% with less gasoline, and less carbon. It is the only known carburetor adjuster on the market, and RANKS FIRST AS A CARBON ELIMINATOR. For priming the motor, you cannot find its equal. PLEASE BEAR IN MIND—THERE IS NO SCREEN, or any other obstacle placed in the manifold, as this will have a tendency to CLOG THE MANIFOLD, and make it more difficult for the motor to absorb the gas and air.

PRICE OF THE M&M—$3.50 and 17c extra for postage. We include either friction foot pedal, or steering post control, which consists of flexible shaft and wire. Requires ¾" pipe tap, which can be reduced to ½" by means of an elbow or a common reducer.



PRICE OF THE MOTORCYCLE SIZE—$1.25 Prepaid. Size ¼".

THE M&M ECONOMIZER IS "THE PATENTED ONE." Warning to users, makers and dealers, PATENT NO. 922,528—May 25, 1909.

The "Black Eagle" Spark Plug

PATENTED

50 Cents Is Enough

The "Black Eagle" Spark Plug has made good because it was designed and manufactured with this result in view.

A person in close touch with the supply and manufacturing ends of the trade was a visitor at our factory recently, and was shown the details of construction, including the machinery, testing, and assembling of the "BLACK EAGLE" Spark Plug. What he said we believe will be of interest to you, as it indicates the effort on our part to supply a high grade plug at a reasonable price. We therefore quote below his impressions.

"I am simply amazed at the workmanship, material, and construction of the 'BLACK EAGLE' Spark Plug. When I saw this plug advertised at a price of 50c to the consumer, I naturally supposed it was a cheap, common, plug such as you occasionally find in jobbing houses on the bargain counter. I am convinced, after seeing these plugs tested, and examining minutely the machine parts which enter into their construction, that **no better porcelain spark plug is offered by any one, regardless of the price they ask.**"

We are not **influenced** by what our competitors **charge for spark plugs!** We have **ignored price precedent,** for the reason that a **high grade spark plug** can be manufactured and sold at **50c each, and that is enough.**

Sent prepaid on receipt of price. Made in all standard threads.

THE STANDARD CO. **Torrington, Conn., U. S. A.**

MIGHTY MICHIGAN "40"

40-Horsepower Touring Car or Roadster, absolutely silent in operation. Burn-Boston Battery

Occupies same space as dry cell and used the same way.

Has Cut Down Battery Cost For Owners The Country Over and Will Do the Same For You.

Read what the manufacturers of the Klaxon horn say—remember that the success of their own product depends on the efficiency of the battery:

"We are accustomed to recommend—— storage battery and *your liquid cell.*"
The reason is that while (we quote them again) "the ordinary dry cell lasts four to six weeks for ordinary touring purposes before the voltage runs too low"—Burn-Bostons on two test runs conducted by the Klaxon people sounded 35,980 and 50,000 calls respectively on six cells 36,000 is is equivalent to fifty calls per day for two years.

After testing Burn-Boston Batteries the U. S. Government found they set a totally new mark for efficiency and *future specifications were raised accordingly!*

The Boston agent of a well known car thus concludes a report of his experience with six Burn-Bostons on his 4 cylinder demonstrator without other ignition. (Atwater-Kent coil):—

"This makes a total distance to date of approximately 14,000 miles, distributed through a period of more than one year and two months, without attention to batteries and yet running strong."

On May 31st last we renewed a set of Burn-Bostons which had been in continuous use on Klaxon and Gauge Light since April, 1909.

Ask your dealer for Burn-Bostons. If he should not have them, send us his name and we will see that you are supplied.

Burn-Boston Battery

19 Doane Street, Boston, Mass.

Write today for booklet, "Service Performances," which further tells the story of economy and efficiency.

Stewart Speedometer

MAGNETIC PRINCIPLE

800,000 In Use

There are now over 800,000 Stewarts in constant use—which is four times as many speedometers as all the other makes combined.

This statement is not published as a boast—but only to furthur emphasize the practicability of the *magnetic* principle.

If the *magnetic* Stewart was not the superior speedometer it could not have grown to be the most popular speedometer.

Such an increasing and indelible popularity is the most sincere and secure indication of satisfaction and success.

The Stewart Speedometer Factory
1926 Diversey Blvd.,
Chicago, U. S. A.
